All you need is aterminal program on the Atari and a terminal program
on the PC, then transfer the files via XDmodem, Ymodem, etc..

I do it all the time....

Is these one of the devices, ATARI built a lot of strange routines into
the XLOS for and an extra device table as it has for CIO devices ?

I _MUST_ have one of these 8-).

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Look at one of the FTP sights for 130XE Keyboard upgrade. You place a 3600 ohm resistor between ground and those pins that control Start Select and Option, requires a little time but definately will fix the problem

So Terry,

If all these "claims" about you being charged with mail fraud are untrue and all these people who haven't received their equipment (I personally know one) and you haven't returned their money is untrue, then why do you keep changing your handle, why do you keep getting banded and why do you ramble on about:

Oh, this is why I stopped programming for Atari

or

I bought a $350 door stop, so its everyones fault so I guess I have a right to steal peoples money and commit fraud and numerous other b.s.

Give it up Terry, crawl back into your hole and stay there, we don't want you, your equipment, your lies and your bullsh*t here or anywhere else, GET OUT AND STAY OUT!!!!!!!!!!!

Not for the "bugfixed" version of David Firth's Atari emulator for Unix, i.e.
it works perfectly. (I'm working on it now).
The koronis rift uses one of the special GTIA modes with a very "uncannonical"
color assignment the emulator has to know. The Koronis Rift game itself doesn't
have this bug but uses this hardware "feature".

Robert,
CSS has a BBS, I've never seen an e-mail address for Bob. The
following info is what I have for the/him:
Computer Software Services PO Box 17660 Rochester, NJ 14617
voice: (716) 429-5639 10am-5pm fax: (716) 247-7158 BBS: (716) 247-7157
300-9600bps.

Try one of these. You might try http://www.four11.com and search for
Bob's e-mail address.

>
>1.79withsomelongstringofnumbersMhz

Just a wild guess. But is the frequency 1/2 of the color
burst crystal from TV sets? Probably the fall out are
really cheap, and stability and drift would not have been
a problem.

>Dont forget that on the atari, the standard 6502 speed of 1.79 Mhz can >be upped to the equivalent (comparing to other systems) of 2.08Mhz by >disabling the ANTIC chip (used for display) .. No other 6502 Computer >allowed this..

This does speed the Atari up, because ANTIC ordinarily steals memory bus cycles from the 6502.

However, it's misleading to say that no other 6502 machine allowed such a thing, because not all 6502 machines were built like the Atari. For example, the Apple II series had no overhead for video memory access at all. Steve Wozniak (the designer) noticed that the 6502 only uses the memory bus in the first half of the clock cycle and leaves it free in the second half, so he had the video controller use the second half of the cycle for its memory accesses instead of stealing full cycles from the CPU. In the Apple II, turning off the video display couldn't possibly speed up the machine because video didn't slow it down in the first place.

(I believe Atari ended up using sort of the same technique in the ST, by the way. As I recall, the ST memory bus is clocked at 16 MHz; the 8 MHz CPU gets half of the bus cycles and the video system gets the other half.)

>

Being a hardware kind of nerd, and at the time having a 6800, 6809,
and the Atari 400 6502 system, my judgement from looking at the cycle
by cycle hardware execution instruction execution times, I figured
that a 2 MHz 6809 was 'ROUGHLY' equivalent to a 4 MHz Z80 (actually
I figured the 6809 2 MHz would be just a shade faster). The 6502 in
the Atari at about 1.8 MHz would be just a shadew slower than the 4 MHz
```

Z80. This was my rough opinions over a period of time when I was building a 6 MHz Z80 add-on board for my 6809 system (never did populate it, ended up buying a 5 or 6 MHz single board Z80 equiv. computer.

Of course, if you count the coprocessors in the Atari (sound and graphics) the overall ability to run graphics intensive programs would definitely surpass a plain 4 MHz Z80 by a long shot.

Message-ID: <Pine.SUN.3.96.970822205347.6626A-100000@flop.ENGR.ORST.EDU>
Source record: 70595

I've been experimenting with anadisk to transfer ED disks from my Atari 800xl to my IBM clone. So far Anadisk is able to completely read some disks, and only partially read other disks. This is ok, because I can always use my Atari to copy files to the disks Anadisk will read.

The disks I want to read are in DOS 3 and DOS 2 format. I could write my own programs to process these files and spit out the files, and then another program to reformat the text files. However I'd like to avoid this if possible. Are there any programs already out there that do this?

If there aren't, would these programs be of use to others in the Atari community? If so I'll make them more robust and portable and make them available on the net. If not, I'll make them quick and dirty.

Hmmm ... I've been using Lynx for this kind of thing, bundled around
some custom shell scripts. Where might one get mirror, might be better
than my shell scripts for maintaining a local tree?? And would mirror
require root permissions?? (My shell scripts work fine as a normal user).

I'm looking for the 9VAC power supply for an Atari 400 computer/disk drive
(they use the same power supply). I'll pay cash, but I'd rather trade
some Atari 5200, 2600, or Intellivision games for it. Please let me know
if you have an extra PS!

Thanks,

-Sam

Didn't the BBC micro run a 6502 at 2MHz? *slightly* faster than the 8-bit.

Well,yeh.Up to 9600baud.
But you'll need a term programme.The RS232 handler is built-in to the 850 so you could write your own if it came with the 850 manual.
(or you already know how R: works)
I wrote a BASIC term programme for the P:R:Connection as a pet project.Pretty damn slow,of course.I tried to get the XIO command in place of the GET command so that I could read up to 256 bytes at a time from the modem.But it never worked.

Probably someone here could write a simple programme for you.Of course this is all assuming you have the BASIC cartridge.

As far as I know,his APE+ speed doesn't make anything faster than when using
UltraSpeed.I'd guess that his OS supports normal UltraSpeed.
(they are NOT the same thing.APE+ speed introduces a new read (and write?)
command,UltraSpeed uses the normal Atari read/write disk drive commands)

I'd check into Bob Puff.He makes the UltraSpeed OS.It (obviously) supports
UltraSpeed with your full 64k of RAM (no RAM OSes defeating 64k games).
It also supports RAM disks.So games that don't let you load DOS can take
advantage of your extra RAM.And so many other features as well.

Or,if you're getting a hard drive anyway,check out the Black Box.
It will automaticly support UltraSpeed (US Doubler 1050s) and
WarpSpeed (Happy 810s (and 1050s I'd presume)) as well as all XF551s.
Also:
RS232 port whose handler is built into the Atari ROM.
(Ataris support PBI devices automaticly)
RTS/CTS hardware flow-control.
SASI and SCSI hard disk drive support.
Parallel printer as P1: through P8:.
64k Printer spooler using XE memory or optional 64k on board.
Text/graphics dump of most screens.
Hard disk partitions can look like floppy drives.
(that is,can look like 90k and 130k drives (128-byte sectors))
Support for hard drives that are stuck as 512-byte sector disks.
96 partitions.Aditional partitions can simply be kept track of on paper
You can change configuration at any time.
(you might have to mess around with memory 559 to get back the P/M graphics)
Physical HD write protect switch.
Built in machine language monitor.
(though you'll have to add your on BRK handler)
You can press HELP-RESET to re-boot the computer.

There's also a add-on PC floppy controller board that'll work with the new
double-speed drives.

(giving you 1.2MB on a 80-track drive,1.44MB on a micro-floppy drive)

Also a BlackBox enhancer.It'll enhance the screen dump by using 16 different
dithering patterns to give you the 16 different shades of the GTIA modes.
Also a slightly different pattern to show that different colours were used on
the screen.
Output sent to P9: will show up on a graphics compatible printer with graphical
and inverse characters intact.(like the G: device)
Basicly it emulates the atari's character set.
There's also a sector editor that'll load up into RAM.
(thus destroying whatever programme/DOS you were using,of course)

Also by Bob Puff.Call 1-716-586-5545.

(as you can tell,I have the manual)

I believe Atari800 by David Firth does, since my Win32 port seems to display them :-). I'd have to drag the 800 out of the closet to see if the colors are accurately blended though.

Yes! That is the name GCP. I think I saw that article in an Antic
magazine.. the screen shots were impressive. They looked like normal
Atari 8bit games. My question how slow were they? I mean colour grafx
and animation at 300 or 1200 bd?

Did any user on this sig ever try GCP out???

This is an open question to Atari 8bit emulator users..

Has anyone got any 8bit emulator (either XLIT or Xformer) to work with an 8bit modem program? (ie Bobterm) I can get bobterm loaded up but no modem handler and it exits. If I can find an RS232.COM file can Bobterm work? Has anybody got this modem program working on their PC?

Anybody....

Jason Moncrief (jmm@galstar.com) is

Moving, must give away to good home:

Atari 800

850 interface box

810 floppy drive

All with power supplies, cables, and manuals

Lots of cart.s (e.g. joust,pool 400,star raider, missile command,

basic, pascal, pilot, etc.)

Lots if SW on diskettes (Castle Wolfenstien, Archon, Cut and Paste,
Forth, etc.)

WAY too much software to list, many with original box,manual,etc.

Software Automatic Mouth, and I may even have a light pen here
somewhere...

Will ship C.O.D. (you pay the postage) to the first intrepid soul to

send me their address.

Also have MANY books on programming (6502 Assy, Games for atari, De Re

Atari, Compute Books, etc.) if anyone is interested in these.

Would like ship all HW and SW to one address, but I might be willing to
break up the books.

I must be at work in another state by Sept 2, time is of the essence, IF
NOBODY WANTS IT, IT'S GOING TO THE DUMP. Email me quick, before Mom
throws it all out.

I saw one at a CES. But Atari took it back (not for trade).
I tried the next CES but was told that it was not being
put into production. Yes, the case was tooled. But
I don't think it ever was offered to the public.

Never tried it out, but I remember an Analog review. The gfx were in the 4-colour character mode, and were integrated into the term program. Thus, no heavy gfx to d/l. It advertised that the system could run at 300, 1200 was better, and 2400, well, who could afford so fast a modem?

"Turbo Basic XL" was published in the German computer magazine "Happy
Computer", a publication of Markt & Technik. Both are extinct. Source code
never was published publically as far as I know and I've never read
anything about it having leaked out. The original author is Frank
Ostrowski, who developed GFA-Basic for the Atari ST thereafter as far as I
know. I really wonder how someone could secure the rights to a freeware
program that is about 12 years old.

In another thread, I wrote of seeing one once. It was on the service bench of a local Atari dealer who has long since gone. I asked about it and was told that it was dropped off for repairs, but never picked up. That was OK -- the service tech couldn't get his hands on schematics.

Somebody else in this NG stated that the drive was released, and then discontinued because of manufacturing problems. Somebody else claims to have the drive AND the schematics. You also have one. So, it wasn't vapor ware.

Speaking of drives, I saw a prototype of the XF351 at a user group meeting. I'm still irked about the attitude of the software houses at that time. Atari wanted to produce a 3.5" drive. They were told that if they did, the software houses wouldn't continue to issue Atari software because the size of the installed base couldn't justify the expense of producing it for two sizes of media. Atari pulled the drive.

Then the software houses turned right around and produced software on 3.5" disks for the Apple //c+ (certainly a new model with limited appeal) and that 65816 Apple (funny how I can't remember what it was called.)

1493. Looking for 32-bit signed integer math routines in 6502 assembly

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-24 00:00:00 UTC
From: Ronald Kneusel <rkneusel@post.its.mcw.edu>
Message-ID: <Pine.SOL.3.96.970824194010.22408D-100000@post.its.mcw.edu>
Source record: 70613

Subject says it all. Specifically, I'm looking for 32-bit _signed_
multiplication and division:

32-bit * 32-bit = 64-bit (or 32-bit ignoring overflow)

32-bit / 32-bit = 32-bit (plus remainder)

I've found 16-bit routines but was wondering if anyone had 32-bit routines
in 6502 assembly handy.

Any help appreciated!

- Ron Kneusel

> HUH?? they did a newer version of star raiders on the st???

Yes, previous posts summed it up pretty well--- they did a remarkable
job re-creating much of the game, but completely failed to carry over
the tight gameplay of the 8-bit version.

> Does the pc emu run it?? and if so, where can I get both the emu and the
> star raider rom??

It's not a rom, it was sold on disk I think. :) Anyway, don't bother,
it's really not any fun. I think I played a pirate copy a total of
about two times, back when I still had an ST around. By comparison, I
still play Star Raiders on one of my 8-bits at least once a month or
so.

>
> -Sam
This was taken from the DOS 2.5 : 1050 owner's manual:

```
The XIO command is a general INPUT/OUTPUT statement used for special
operations. It is used when you want to perform some of the functions
that would otherwise be performed using the DOS Menu selections. These
XIO commands are used to open a file, read or write a record or
character, close a file, reference a location in a file for reading or
writing, or to rename, delete, lock, or unlock a file. Note that
XIO calls require filespecs.

CMDNO OPERATION EXAMPLE

13 STATUS Request XIO 13,#1,0,0,"D:TEST.BAS"

32 RENAME XIO 32,#1,0,0,"D:OLD, NEW"

33 DELETE XIO 33,#1,0,0,"D:TEMP.BAS"

35 LOCK FILE XIO 35,#1,0,0,"D:ATARI.BAS"

36 UNLOCK FILE XIO 36,#1,0,0,"D:DOSEX.BAS"

253 FORMAT DISK XIO 253,#1,0,0,"D1:"
(format single density)

254 FORMAT DISK XIO 254,#1,0,0,"D1:"
(format enhanced density)

++++++++++++++++++++++++++++++++++++++++
```

I believe that one of these last two should do the trick.may be a
better way, don't recall.

```
Hope this helps.

cheers,
robert
```

As I remember (from reading about it--never tried it myself), the games were not downloaded as you played. Rather, they already were on your computer (either as a cartridge, a disk, or downloaded earlier--not sure which). Only your joystick movements (and your opponents') were transmitted, so everything was in realtime and played like normal games, except your opponents were somewhere in cyberspace (as we now call it). Games you can play over networks (and the internet) are the same idea.

Does anyone know what's wrong at 'THE JAIL', Atari 8-Bit BBS of Sysop the Warden ? (Toronto/ Canada).

I'm asking this cause Europe is networking with the Jail. ABBUC in Germany is getting mail over there, and the Jail should get mail at Thunderdome in the Netherlands, but since a few weeks no new-mail arrived in Germany, and the mail at Thunderdome is still waiting to be networked with the USA and Canada...

Sysop FOX-1

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

: Bo.

: ps, you could try and find a real Atari printer in that hardware box :D
: ___ Blue Wave/386 v2.30

One such device to hook an Atari 8-bit to a parallel printer was the
MicroPrint by Supra Corp. It had a Centronics connector on one end of
a 5 foot cable with an oversized shell containing a small circuit board.
On the other end was an Atari SIO connector. It'd work with any model of
A8 except the 1200XL (simple modification required to the computer). I
believe American TechnaVision (510-352-3787) still has the MicroPrint for
$9.95.

Ask and ye shall receive:

A dead 130XE
A dead XF551
A seldom-used XM301 (300 baud for 800XL, XE series or hacked 1200XL)
Two dead 800XLs
One 800XL with less than 10 hrs. on it
Four 1050 FDs (one with less than 5 hrs. on it), all working
MANY Atari peripheral cables
Five 800XL power supplies
And a few odds and ends I haven't seen in a while...

Anybody need anything...(?)

I got mine to work only after messing around for quite awhile.

Problem #1 - Won't work under Windows 95. You need to create a boot
disk or run an older version of DOS from disk

Problem #2 - Doesnt work with my 1050 Happy drive. Only worked with my
normal unenhanced 1050.

I had other problems as well but have pretty much given up on it since I
can't writer back to the disk, can only read. I use my SIO2PC cable.

1506. Atari 130XE/7800 RGB??

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-25 00:00:00 UTC
From: Julian Eggebrecht <julian@factor5.com>
Message-ID: <3401F885.26399EEE@factor5.com>
Source record: 70622

Does anybody know if there is any chance to get an RGB signal out of an Atari computer or out of an Atari 7800??

In addition to that, has anybody modified his 7800 to have composite output? I did this with the method given at Greg Chance's site and the picture is still not as sharp as a regular Atari 8-bit composite picture. It could be much brighter, in addition.

Let me know if any of you fiddled around with that...

My next door neighbor had a C64 and I an Atari 800. When the arcade games were released on computer the Atari version always lacked (esp in graphics) The most unfort thing was that Atari itself was producing this garbage, but anyhow yes Dig Dug on the 800 seems sluggish, has crappy graphics, and doesn't play like the arcade.

Actually, I take some of that back. The ground color was faithful to the arcade thanks to 256 colors whereas the C64 wasn't.

Hmmm, I think it may just be a tad unfair to compare a stock Atari 800 vs. the C64. The Atari predates the Commodore by a good bit of time. I remember buying a new 130XE rig for around $500 just about the same time my brother bought a new C64 outfit for around $1000 - even then Atari output was already in great decline, while new programming tricks were still being found on the Commodore. Be that as it may however, I also think that a lot of differences in the games were also the results of the code rather than the hardware.

Along those lines, I have the eternal wish that all 8-bitters of the time had - why oh why couldn't they (Atari) have taken the earlier versions of the classic arcade games and updated them to take advantage of the increased capability of the XE-class machines? I guess the answer, as always, is economics. Towards the end, a Super 128k Dig-Dug (or Joust or Pac-Man or Donkey Kong or whatever) using all of the memory, graphics, and sound tricks available to the 130XE wouldn't probably have returned the investment in development...

Hello Maury,

>> Just a wild guess. But is the frequency 1/2 of the color
>> burst crystal from TV sets? Probably the fall out are
> This likely explains why the machines ran at a different speed in Europe

That and the fact that the frequency of our ac supply is 50Hz, not 60Hz.
Knowing that some software took it's timing from locations 18, 19, & 20,
which looked at the supply frequency.....

1519. ANOTHER TERRY ORTMAN ANNOUNCEMENT

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-27 00:00:00 UTC
From: Curt Vendel <cvendel@aol.com>
Message-ID: <34046028.30A08CD2@aol.com>
Source record: 70539

Terry,

You LOSER!!!!

Try to tell the WHOLE truth, not your truth. I told you I'd buy
your ATR 8000 IF since you have such a bad reputation I could do the
following:

1. Ship the ATR8000 COD cash only
2. Since I'm friends with the UPS drivers I'd open the box in front of
him to see if you
actually sent me the ATR8000 and not a brick.
3. As for the TRAK disk drives... YES I did have them and I GAVE THEM
AWAY to
the members of the Ol' Hackers club in Long Island, New York.

Terry,

Get something VERY VERY straight, don't even bother to try and turn
things around when it comes to me, too many people know me personally
and know I don't pull bullshit, especially the type of bullshit you
pull, you messed with a friend of mine, stole his money and never
shipped his goods, so you can bet your sweet ass that anytime I see a
post from you I'm going to plaster a warning all over the newsgroups,
all over the Telnet BBS's you haunt and even the old analog dial-up
BBS's you hide and lurk in. I'll make sure everyone knows your the
criminal you are. I'm not the one hiding, I'm not the one who is
barred from half the internet, I'm not the one who has to change my
handle every week, I'm not the one who has to call myself ANONYMOUS, I'm
not the one who puts a PHONEY reply address when your REAL reply is:
TORT@SPRINGNET1.COM. You wanna steal from people, then get real used
to people comming down on you and haunting you, thats what happens to
criminals!!!!!!!!!!!!

Curt

A CSS Black Box is a T shaped interface card that plugs into the back of an Atari 800XL or 130XE (Never seen one plugged into a 600XL).

The interface give you a ROM based debugger and sector editor, a SCSI - 1 compatible hard drive interface, a Parallel port interface and a high speed Rs-232-c serial interface. There is also an expansion header on the interface for a parallel bus disk drive controller daughterboard (sold seperately). It is a very nicely made interface board and works very well, one note though: the interface board does NOT come in a case, its a bare board only. CSS used to sell a case, but it was very poorly made (unlike the interface itself which is high quality). Its nice being able to BOOT from a SCSI hard drive connected to your Atari and keep practically all of your data and games on hard disk. Once your hard disk is set up and running and all your data is installed, you don't even need your disk drive connected or turned on anymore (unless of course you need to copy something to or from a diskette).

As far as function, it's 6 of one, half dozen of the other. Since they
are not intelligent devices, they work equally well on 400, 800, XL's and
XE's. The 1010 only takes up a little more than half the footprint of the 410.

Windows is a great OS. It's bumbling users (like yourself) that don't
realize that different character sets have different characters. Try
using a character set that conforms to ANSI specs. :)

It's an add-on board for the 600XL, 800XL, and 130XE. It adds an RS-232
port, a parallel printer port, an SASI/SCSI hard disk port, and some OS
enhancements. [Paraphrased from the CSS brochure.]

Hello Curt,

>unresolved. The Antic and GTIA were just never intended for RGB use
>and to give the same colors as a composite signal.

That's pretty much what I thought.

> But there is hope! For $125 you can buy a TV to VGA adapter box,
>ATI Tech makes just such a converter box.

Even at $125, it's too pricey, IMO. Doubly so, for a system that has an
inherent value of under $50. As you say though, the option is there.

A 8088 is a 16-bit chip.We're talking about Z80s,a enhanced version of the
8080.
What were you doing that gave you such a speed advantage of a 16-bit CPU?

>It is very easy to complie code for the Z80. But the 6502
>*requires* human assembly language coding. A 65C02, EVEN

Well any professional programme requires human assembly.What are you going to
do it in? Compiled BASIC or C? (both need a run-time)
I can understand a beginner using ACTION!,but you should eventually move
towards assembly.(at least in part)
I've heard that on the PC many programmes are written in VISUAL BASIC!
BASIC is fun,but it's time to crawl out of the cradle eventually.

>TODAY, is a very competitive processor. (and I hate Mensch)

>limitation? --

The Commodore has MOBs instead of P/M (Player/Missile) graphics.
There are 8 MOBs (as opossed to 4),and they can have multiple colours.
(you have to combine two (of the precious 4) to do that on Atari)
They're also faster to move verticaly.And wider.
(but Atari's are MUCH taller)
Single coloured MOBs are in the 320x200 resolution.
(P/Ms are rendered in 160x200,as are multi-coloured MOBs)

Commodore seems better for arcade games.Gauntlet is also faster on the
Commodore.Atari is better for Atari-specific games like BallBlazer.

I'd say that the game was made by someone used to arcade-style graphics.

>confused... Thanks,

A 1030 modem has a built-in handler and term programme that'll work in 16k.
But remember that most PC BBSes are made on the assumption that EVERYONE has a
PC and hence everyone has ANSI (as opossed to VT100),IBM character sets and
80 coloumns.

If you're not serious about the atari,just check out a thrift store for a cheap
PC.

Personally,

I liked Donkey Kong, Donkey Kong Junior, Joust, Frogger and Defender.

Pole Position, Dig Dug, Wizard of Wor(played well graphics stunk),
Q*Bert, Pit Stop I&II, Racing Destruction Set, Mail Order Monsters are
prime examples of cutting corners.

Pole Position was ok(I like it better now) and Wizard of Wor plays well
just looks bad.

I mention many above that wer Electronic Arts titles who were notorius
for not producing quality Atari8bit titles near the end.

Later,
Steve

>just to read and write to a newsgroup is a bit much, don't you think? Lighten
>up.

I don't think it's a bit much at all, especially in light of the fact
that there are so many different character sets used around the world
which you so kindly reminded us. Using an ANSI set is a good way for
people to have a common set of characters. Windows has enough bugs
and problems that it doesn't need people like you to artificially
attack it at every oportunity. Is that light enough for ya'?

Hehehe.

Yes, Zeppelin was one of their best games ever.
But they didn't only wrote games,
the Synapse SynAssembler is one of the best Assembler I use/know.
AFAIK there never was an update for this program.
Can this program still be sold, or is it "pd" now?

Nope, I used the same software I used for years. Nobody else complained. Just you. I wouldn't consider using English in Engalnd/America/Australia, French in France or German in Germany, so just the same, it's not a 'bumble' to use an english character set in England, is it?

>attack it at every oportunity. Is that light enough for ya'?

Yes, Windows has enough bugs. I was trying to point that out in a lighthearted way. And I don't artificially attack Windows. I really do hate it. I hate it because a neat OS like Atari DOS fits into about 8k, GemDOS (ST) fits into 192k and Windows eats up about 60+ megs doesn't do much extra that a few utils and would do, and does it all a lot more inneficiently. Yes, I could use another O/S, but what (realisitcally speaking) would run on it. At least with Windows your (fairly) compatible, even if some nit picking moron comlpains about a character set.

1549. CompuServe closing Atari forums :-(

Newsgroup: comp.sys.atari.8bit

A-Non-Y Mouse wrote:
>
> Ok, what did I do wrong? Is the 1020 considered a dog? I like
> mine......

I liked my 1020 too. The problem was that it was very difficult to get supplies for it such as paper and pens. For a while, Radio Shack was selling rolls of paper that were a little to big (radius wise) that worked as long as you transferred about half of the roll to a blank spool, but I doubt that they sell that now.

Pens were the larger difficulty. A local Atari store sold some (non-Atari) pens that were just barely too big for the printer, and so didn't work.

I liked the plotter; I thought it was fun to watch the little pens draw the letters in any of four different colors. I also liked the tiny 80-column mode. I wrote a bunch of stuff to draw with it, including a birthday card with a graphical birthday cake (complete with candles) on the front. Later, I got a P:R:Connection and a Star NX1000 9-pin dot matrix for major printing needs.

Since supplies for the 1020 are probably pretty limited nowadays, it's probably not as useful a device as nostalgic.

Is there supposed to be a single POKE that does this easily?

AFAIK, you have to set the scrolling bit in the display list
for each line of text on the display. There's a hardware
register to bang on to do the fine scrolling. After reaching
the limit of the fine scroll then you coarse scroll the
display and reset the fine scroll register.

>(3) Keyboard sound off: POKE 731,1 (,0 to turn back on)
>
>(4) You didn't ask, but turn off disk I/O noise: POKE 65,0 (I think, 1=on)

>allowed this..

You've actually upping the 6502 to 1.79Mhz. By stopping ANTIC DMA you
are only allowing the CPU use the cycles that ANTIC would have used
(about 20% of the time). So, the 1.79Mhz CPU is then using all the
1.79Mhz of clock cycles available to it.

Hey William,

Nice touch at the end of your message, yes he is a lunatic obviously living in his own little demented world. That was why I was more then willing to put an end to all this BS and fly out to his so called "business" to see for myself, take some pictures and set the record straight. The obvious truth is that Terry "works" out of his bedroom in his mom's house, there are no corporate accounts, no websites, just Terry trying to sell about $100 worth of Atari 8-bit equipment (if he actually still has it) for $1000 because he thinks its actually worth that much, perhaps 5-10 years ago YES, but now its just inexpensive momento's from a 8-bit era. Don't get me wrong, I LOVE my Atari's and still play with them and enjoy tinkering, but they are just not the mainstream anymore, back in 1980's yeah, they were state of the art and they were THE computers to have, but time marches on... I think Terry is still in the 80's, I guess thats not too bad, after all retro is in these days.

Curt

I believe that a lot of the CIS stuff exists at UMICH and also on the
PoolDisk that was produced by Ernest and Bo Schreurs in The Netherlands
about two years ago, but I also see that William Kendrick replied to
your message, so I'm going to look at this reply before commenting
further on UMICH.

Last I checked you can still order documentation (Atari-specific, in fact), specially coated paper, and ribbons from Okidata for the Okimate 10. I doubt they still sell the software that came with it, though, which was pretty crude anyway (some demos and a utility for printing Micropainter and Koala format pictures). Pretty nifty little printer, actually. It would be nice to have some more sophisticated software for it.

Also, it works great on thermal fax paper with no ribbon for simple, quiet printouts.

Brent

The 8088 is only 16 bit internally. It still has only an 8 bit bus.

I didn't bother answering that post. Yes, the 8088 has an 8 bit I/O. Still the internal structure should be a lot better than the 6502. But it isn't faster, when the 6502 (OK, I used the 65Co2) is correctly programmed. And the 65C02 is a VERY small chip.

Who is Mensch? He is the (at the time) Motorola engineer who developed the 6502 and its heirs.

i just got a lot of old 8-bit software..

included was the synapse game...survivor w/box manual.

i am going to attempt to put it in .atr format and upload it to a site,
either yogi's or ??? also will send the manual to

http://www.crestviewfl.com/~richard/atari-docs.htm!

if he will allow.

any advice to .atr this file?

aside: thought it isn't synapse stuff, i got a cart. copy of bounty
bob strikes back....anybody know how to archive it?

thanks,
robert

>Is there supposed to be a single POKE that does this easily?

Here's what I got from Mapping the Atari.

POKE 622,255 (POKE 622,0 to dis-able)
(622 / $ 26E = FINE)

This works for the XL/XE (but I'm not sure about the 1200).

I think you have to follow with a GRAPHICS 0 to actually enable the scrolling.

>AFAIK, you have to set the scrolling bit in the display list
>for each line of text on the display. There's a hardware
>register to bang on to do the fine scrolling. After reaching
>the limit of the fine scroll then you coarse scroll the
>display and reset the fine scroll register.

I think that may be how to do the equivalent of POKE 622,255 on the 400/800.
Mapping the Atari mentions something about the display list becoming one byte
longer after POKing 622 with 255.

The Fluffy AE.

Ahh, it wasn't me who complained. I really don't care that much.
What did bug me, is how you bashed Windows for something that was a an
operator preference condition (choosing a character set). I saw it as
artificial and inappropriate and I called you on it. I was not the
one complaining about the appearance of your text.

>>I don't think it's a bit much at all, especially in light of the fact

Seems pretty clear to me that's exactly what you did sir.

> I really do hate it. I hate it

I figured that. Why else bash it undeservedly.

>because a neat OS like Atari DOS fits into about 8k, GemDOS (ST) fits into
>192k and Windows eats up about 60+ megs doesn't do much extra that a few

Ya know there guy, I really am an Atari8 enthusiast, but you certainly
just destroyed any credibility you may have had. To say that an
Atari8 OS (any of them) is only slightly less capable than a modern,
large, and feature packed OS such as Windows95 is quite an exercise in
self inflicted blindness. I believe my 800XL uses the best 8-bit OS
around (SpartaDOS X with a Black Box) but I have to be real though
too. Sheesh.

You mean 8-bit DATA bus. It has a 20-bit ADDRESS bus and 16-bit
registers. It is in fact simply an 8086 where they reduced the data
bus to 8 bits instead of 16. The 8088 came out after the 8086 as an
easier solution to implement it in the largely available 8-bit
motherboards of that era. Developers could put a 16-bit processor
into an 8-bit board architecture.

Is this a recent copy of their data? I know umich (?) has a bunch of stuff
from CIS but I know they don't have everything. I remember their being tons
of stuff more when I last used CIS in the 80's. When the new version of 1030
Express came out. In fact, there should be a program of mine up there that
converts version 2 to version 3 phone files.

If you want some help I could lend some time to it. I'm not sure how you
want to do it though. A large tar ball of some stuff would work for me.
(Guess I should get the Unix Atari emulator up and running...)

I would imagine that its heavily copy protected like all Synapse
products, so there are 3 options.

1. Dont do it 2. Use APEs pro system cable 3. crack it yourself.

Im in luck as I have a deprotected atr of it already. BTW it does not
work on XL-it at all well, the ship blows up when the screen scrolls
up or down which hampers game play just a tad...

Works a treat on Atari800WIN bar a line at the top of the screen but I
have no idea about Rainbow as I dont have that emu myself...

>bob strikes back....anybody know how to archive it?
>
Its not a simple process nor do I want a hard time for seemingly
promoting piracy. Needless to say its already about on sites and has
been archived/ pirated/ copied long ago...

If you get a C64 emulator its on quite a few sites since their groups
are not so fussy about archiving the software before it goes for good.

KJ>>(2) Scrolling: Dunno offhand

KJ>Is there supposed to be a single POKE that does this easily?

Not a single POKE.

KJ>AFAIK, you have to set the scrolling bit in the display list
KJ>for each line of text on the display. There's a hardware
KJ>register to bang on to do the fine scrolling. After reaching
KJ>the limit of the fine scroll then you coarse scroll the
KJ>display and reset the fine scroll register.

It is not that difficult but only works on XLs.

Try this:

```
POKE 622,255
OPEN #1,12,0,"E"
CLOSE #
```

Whilst reading the rubbish I usually find here, MICHAEL ATKINSON wrote something interesting about Re: Atari 130XE/7800 RGB??,

Hello MICHAEL,

>users as artifacting doesn't work in PAL anyway.

Actually, it does. However, not in the same way that it works on NTSC displays. NAU published an article, with accompanying demo programs showing the result. TBH, it's barely noticeable.

>chrominance signals seperately, and these have to be decoded at some point;

And it's the decoding that's the problem; It generates noise. The fewer components to "interfere" with a signal, the better.

That's not meant to imply it should be possible to stick a TV aerial down-lead straight onto the back of a TV tube, and expect it to work, BTW. :-)

>How do I get the cord for it?

You need a special Atari 410 program recorder. If you have to ask,
you cannot connect a standard cassette tape player to the Atari.

>2) Can I get a modem for my Atari 400? I assume it plugs
>into the side of the computer. I would love to be able to
>get online using my Atari 400.

You need an 850 I/O connection box. Then you can connect
a modem up to 9600.

>3) Can a disk drive be connected, or is the cartridge slot
>the only way to load software?

Programs can be loaded by means of cartridges, tape and
disk. You need and Atari 810 disk drive.

Hmm.. over here in the UK there are at least two cheap and cheerful electronics companies who chose a Japanese sounding name to hint at quality and advanced technology - Matsui and Saishio

All rather ironic really, as Sony, Pioneer and Panasonic et al chose their names to sound Western (according to urban legend Sony was meant to be called Sunny, but was mistranslated..)

Whether Atari had similar reasoning, I dont know (probably unlikely now I come to think about it - did the Japanese have much of a reputation for computer games before Space Invaders was released?)

There are other modems/modem interfaces to choose from. I don;t know if a
PR connection works on the 400/800, but some direct connect 300 bd modems
would work (like anyone would surf the net at 300 bd! :)

The Atari 400 could use other drives too! I ran my Xf551 off my Atari
400. My 400 was built in 1982, and the Xf551 was built in '87. The big
question is ram.. a 16k Atari 8bit can barely load up Dos 2.x.. but I
was able to load some 8k, 12k games on my 400.. (it only had 16k of ram)

1597. -More- GemDrop advancements

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-31 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5uctvv$ql2$1@nuke.csu.net>
Source record: 70517

Well, I actually had a chance to play the game I'm basing "GemDrop" on.
I was mistaken! :) It's called "Magical Drop" not "Lucky Drop."
(Maybe I was thinking of Lucky Charms... they ARE magically delicious,
you know!)

Anyway, I added some sprite-based effects which adds to the game a lot,
and fixed up the game rules to be more true to the arcade game.
(Not perfect, but still playable.)

This upgrade includes "killing" pieces in different directions.
If you get a column of gems lined up, they go away, as before.
But now, if there are any OTHER gems of the same color next to this
column, they'll go to! And so on. Makes for some spiffy chain-reactions!

I still need music! ;)

OK, OK ... something convinced me to grab the files before
they vanish, so I now have all the files from section 11 and
12 of the CI$ ATARICOMPUTING forum, though I have to kludge them
together into one place (section 11 was grabbed with Qmodem at work,
while section 12 was grabbed with Tapcis, a much smarter CI$ aware program).
I will have to write a parsing program to split out the file descriptions
into the individual description for each file that Tapcis does to get them
consistant, but that shouldn't be too much trouble. 1800 files in section 12,
I haven't yet looked into the section 11 stuff yet.

The paper listing I had at work is definitely gone ... I hope I have
the original files on a 6809 Flex disk someplace.

I read that when Warner took over,a lot of the creative programmers left.

>Actually, I take some of that back. The ground color was faithful
>to the arcade thanks to 256 colors whereas the C64 wasn't.

It's only 128 colours/shades.You get 16 shades (instead of 8) and 16 colours
for 80x200x9 mode games.(GTIA 80x200,that is)
Games like Draconus and Zybex are 160x200x4 (and monochrome) and Ultima and
Lode runner are 320x200x1 (with artefacting for 4 c/s).

(of course these are just "standard" screen sizes.A game could just as easily
use 192x200.This is the same resolution as 160x200,just more of the screen is
used.It can also use 128x200.The same goes for other modes.
Also ANY number of lines can be used)

1603. Huge list of 400/800 games FS

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-01 00:00:00 UTC
From: Jan Lai <jlai@idt.net>
Message-ID: <Pine.GSO.3.95.970901123338.4912D-100000@u2.farm.idt.net>
Source record: 70427
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.marketplace

Hi fellow rgvc'ers:

Don't play them much anymore so it is take to part with them:

here's the list of games:

Atari brand 400/800 games:

Pengo
Ms. Pacman *SOLD*
Dark Chambers (XE)
Pole Position
Joust
3-D Tic-Tac-Toe
Galaxian
Midnight Magic (XE)
Necromancer (XE)
Star Raiders
Jungle Hunt *SOLD*
Missile Command
Donkey Kong Jr
Ballblazer (XE)
Moon Patrol *SOLD*
Eastern Front (1941)
E.T. Phone Home
RealSports Football
AtariWriter
Centipede
Qix *SOLD*
Robotron 2084
Basic
Pacman
Space Invader
Dig Dug
Sky Writer *SOLD*

Non-Atari brand 400/800 games:

Miner 2049er (Big five)
Gateway to Apshai (Epyx)
Jumbo Jet Pilot (Thorn EMI)
Pitstop (Epyx)
Fraction Fever (Spinnaker)
Buck Rogers (Sega)
Gridrunner (HES) by Jeff Minter *SOLD*

Serpentine (Broderbund) *SOLD*
Atlantis (Imagic) *SOLD*
Survival of the Fittest (ISDI)
Popeye (Parker Bros.)
Wizard of Wor (Roklan) *SOLD*
Gorf (Midway/Gorf) *SOLD*
Soccer (Thorn EMI)
HERO (Activision) *SOLD*
Kids on Keys (Spinnaker)
Kaboom (Activision) *SOLD*
Q*bert (Parker Bros.)
Congo Bongo (Sega)
Dance Fantasy (Fisher Price)
Pitfall II (Acitivision) *SOLD*
Alf in the Color Caves (Spinnaker)
The Dreadnaught Factor (Activision)
Alien Garden (Epyx) *SOLD*
Story Machine (Spinnaker)
Facemaker (Spinnaker)
River Raid (Activision) *SOLD*
Frogger (Parker Bros.) *SOLD*
Jumpman Junior (Epyx, PCB board is off but works)
Star Trek S.O.S.(Sega)

The price is flexible, I'm generally looking for $3 for each game, $2 for the more commons (Pacman, AtariWriter, Star Raiders), and more for rarer ones.

Let me know if your are interested!

Modeming stuff over... Hummm, that probably means you have an 8-bit
computer WITH disk drive, right?
Why not use SIO2PC then? You can use this interface to transfer files
easily from your 8-bit to the pc.
There are programs which allows you to read 8-bit disks on the
5.25" disk drive from a pc. I tried them, but AFAIK no one worked...

1607. Monitor chaos - run away!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-01 00:00:00 UTC
From: Loose Cannon <loosecannon@jumpnet.com>
Message-ID: <01bcb71a$45434340$2051c4ce@loosecannonhome>
Source record: 70431

Ok, who's got the info on how to hook up an Atari 800XL to a Commodore 1084 or 1084S monitor? Basically, there's a 5-pin DIN (round plug) coming out of the Atari, and I need to get that over to the nine pin plug on the monitors. The monitors also have composite inputs, which I managed to get going but only by making an RF modulator and routing the composite out of the Atari through the TV, which then gave me separate video and audio RCA phono ports to plug into the monitor (and if I have to use a TV, it kind of defeats the purpose.)

Essentially, I think it all comes down to this...

1) Either I take the composite out of the Atari and find a way to separate the video and audio info and then pipe them into separate RCA phono jacks on the monitor or...

2) I take the Atari's monitor output (5 pin) and figure out what (if any) pin switching and wire crossing I have to do to make it happy with the 9 pin Commodore RGB inputs.

Somebody reply quick, or I'll be posting, "Where do I go to repair a Commodore monitor?" by sometime tonight...I just went and bought the old voltmeter, so I'm now armed and (from my monitor's point of view) extremely dangerous. "Maybe this wire goes here...phizzzzztttt!...no, maybe not...maybe it goes here...Ow!...maybe...."

Source record: 70432

The Atari din has the perfect outputs for your monitors. Besides a
separated audio and composite signal, the din also has a separated chroma
and lumina signal that can feed into the separated chroma and lumina inputs
on some Commodore monitors. Which is which? I'll let someone else say or
you can just spend a few bucks on a cable from B&C or wherever.
Let us all know if you zap something :)

Whilst reading the rubbish I usually find here, Mat Simpson wrote something interesting about Re: Atari in music?,

Hello Mat,

>electronics companies who chose a Japanese sounding name to hint at
>quality and advanced technology - Matsui and Saishio

Cheap, yes. Cheerful? They're rubbish.

>All rather ironic really, as Sony, Pioneer and Panasonic et al chose
>their names to sound Western (according to urban legend Sony was meant

Quite so.

>Whether Atari had similar reasoning, I dont know (probably unlikely now
>I come to think about it - did the Japanese have much of a reputation
>for computer games before Space Invaders was released?)

Not really. It all started in the USA. As ever, the Japanese were Johnny-come-lately's. Of course, nowadays they've made their mark in other areas.

At the time that Atari were being set up, there was a lot going on in (what's now called) Silicon Valley. Maybe choosing unlikely names was one way of fending off prying eyes?

There are two versions (at least) of Dig Dug for the 8bits released by
Atari. A rather shabby looking version comes in the brown 400/800 cart
style case. The silver XL version of the cart is much better. The graphics
are much improved.

Karl.

Hi,

I'm looking for any old issues of C&VG magazine published in the UK.
It's one of the very few magazines that started way back at the start of
the 8-bit days and is still in publication, (current issue #190).

By old issues, I mean very old issues, ie. pre 1985. My earliest issue
is from 1982 (Dr. Who Cover). The rest covering 83/84/85.

They covered at the time, most 8-bit formats, Atari, Acorn, Sinclair,
TI, Dragon, Oric, Aquarius, New Brain etc.

Mail me, or post to this thread if you have any issues for sale.

Thanks

Ian (ian@infoserv.demon.co.uk)

>enhanced density format. If you are using SpartaDOS X, use XIO 254,
>#1,0,0,"Dn:", which will bring up the SD disk formatter menu.

In DOS,254 sends a 1050 format (double density/128-byte sector) command first.
If that doesn't get accepted by the drive,it tries the normal format command.
(make sure your Indus GT or whatever other double density/256-byte sector
drive is set to single density.Putting in a DD/256 disk an trying to read it
will just produce errors and switch it to DD/256 mode)
When you use the "I" command from DUP,this is what you're sending.
Remember that MyDOS can read 1050 DOS disks but it doesn't understand the weird
VTOC of DOS 1050 disks.(in understands single density,though)
And DOS totally doesn't understand MyDOS 1050 disks.

XIO 253 allows you to specify what density you want.This is what the "P"
command does.But I don't know how it works and MyDOS doesn't support it.
(you can do the same thing through MyDOS's XIO 254)

I just finished building the PC Xformer cable, and I can't get it to work.
Xformer says it can't calibrate the drive.

I'm using a stock 1050 drive under MSDos6.22/NDos. Should my printer
port be setup to something other than "bi-directional printer port", ECP
perhaps? What drive letter should the 1050 be set to? Do I need a disk
in the drive? etc.. etc.. not very well documented. =)

Actually, I'm just looking for a way to interface the 1050 to the PC
and some C code to drive it. I want to write Atari disks from Unix, but first
I thought I would try the Xformer. And yes, it is built correctly.

1619. BASIC floating point routines in ACTION!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-02 00:00:00 UTC
From: cv436@torfree.net
Message-ID: <EFv7LD.H9s.0.sheppard@torfree.net>
Source record: 70439

Anyone know of a code library for ACTION! which implements the floating point arethmetic functions of SQR(), COS(), SIN(), and ATAN(), that are normally only available when running some form of BASIC?

I've more or less figured out a quick 'n' dirty SQR routine, but I'm not sure the math is completely sound, although when the algorithm is tested against BASIC XE's SQR() function, they come up as being off by only a fraction.

Anyone care to guess why OSS (who created Atari BASIC), didn't include the above mentioned fucntions into the REAL.ACT code library that comes with the ACTION! Toolkit?

Later...

Source record: 70442

FREE STUFF IN NORTHERN NEW JERSEY:

Hello All,

I am planning a move into a very small house, leaving the rather large house of my childhood behind. I have several small collections of items which may be of interest to users on this newsgroup. I'm sorry that some of the items are off-topic, but it was much easier for me to make one post to several areas.

If you are interested in picking these items up, please write me an email, fxites@aol.com. I am offerng the items for free, but I certainly would not mind if you felt like making an even trade with any small items that you wish to part with.

Anyhow, here's the stuff:

BASEBALL CARDS...

A small collection of assorted, loose baseball cards, dated between 1987 and 1993. I have not priced each card, but I would estamate that the book value of all the cards would be between $50 and $60. Take them or leave them. If you pick one up, you take them all. Why not? They are FREE!

COMIC BOOKS...

An even smaller collection of comic books, assorted dates. I have several loose, tear-up copies of older comics that were great fun to read, but have no collectable value, as well as two Spawn #1, and the entire Spawn series thru about #20, in addition to other slightly less valuable recent comics. I would estamate that the value of these comics is under $50, but I would really like to hear trade offers for them. If all else fails, I'll let them go for free.

ATARI STUFF...

Many assorted bits and pieces for Atari 8-bit computers, as well as an Atari ST computer with monitor. I was given a very generous collection of Atari items by a member of the Atari Elect this past year. I have had time to figure out which items are of use to me and which are not. I would be happy to see these items go to a good home. If you are in the Northern New Jersey area and can pick up several boxes of stuff before the 23rd of September, they are yours.

STUFF THAT I WANT...

IF you have any carts for the Atari 2600, 7800, 5200, Lynx, Jaguar, or any Atari ST hardware (midi perhaps!?) that you would like to offer in exchange

for any of these items above, please let me know. My first priority is getting all of these wonderful items into a good home, but if I can hook myself up with a few new toys of my own, that would be great.

Please email if you are interested.
-Jon

And the #1 most frequently asked Atari 2600 question is... <drumroll>
"What kind of power adapter do I need for my 2600?"
The answer? 9 volt DC @ 500 mA with a 1/8 inch, possitive-tipped plug!

Don't forget those OSS people are the same dudes that made Atari Basic
have rounding errors in a lot of its math routines. (Those with an OLD
Atari Basic CXL4002 rev A cart can testify to the 2^2 not equaling 4. It
goes to 3.99999999996 or something odd like that.... and it taking
forever. I remember some old type in listings in COMPUTE used to use the
^ function as pauses instead of using empty for/next loops! heheh

As someone else mentioned, Synapse was merged into Broderbund way back when.
Broderbund is still around (http://www.broderbund.com), so presumably
they still own the rights to all the Synapse titles.

What is the purpose of this game? You ride around, look in some castles, but there doesn't seem to be any purpose. I think this game won a bunch of awards, but I don't know why. Is there some aspect to this game that I am missing?

Try this page before looking at a program to read your disk:

http://seka.nacs.net/~classics/

The program is called Atari Peripheral Emulator (APE), is fast and works
well, and the interface is cheap/easy to build (or buy). There is
another program which I've had less success with, but will also do the
trick, called SIO2PC (current rev is 4.1), available from a number of
FTP sites.

gud luk :)

But that's not what he said. He said freeware, which is NOT public domain
software. Freeware is freely distributable, _copyrighted_ software. And
copyrights associated with Atari software will not be expiring for many
years.

If someone released a program as freeware 12 years ago, he still owns the
rights to it now.

1629. Re: XFormer Cable Questions

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-02 00:00:00 UTC
From: Stephen Knox <gooch@pop.erols.com>
Message-ID: <340C6365.4523@pop.erols.com>
Source record: 70449

I got my XFormer cable to work under the following conditions:

1. Boot DOS from floppy (It came be done with Win95 DOS)

2. The drive id setting needs to be correct (ie, the switches
need to be set to the drive your trying to get XFormer to
recognize)

3. Your LPT port needs to be something standard (I forgot the
address)

4. Use a standard drive. My 1050 Happy drive didn't work. I
had to use an unmodified 1050 to get it to calibrate.

And most importantly, you CANT write to Atari disks. You can only read
with the code in 3.6 (Atleast all I get is write errors)

Later,
Steve

Alright... is programming raw SIO port access as easy as I think it is?

Output:

(1) Set SEROUT ($D20D) to the byte
(2) Set bit 4 (SEROR) of IRQEN ($D20E)

Input:

Similar, but more complicated... need to look into it.

Please get back to me with comments on this idea (ie, am I right or
wrong!?)

Thanks! :)

Karl,
I don't think anyone has gotten it to work. Mine DOES go through the test properly, but nothing after that. I'm using PCXf3.60 and an XF-551. I've tried booting PCXf with SD 3.3, and AtariDOS 2.5. I should try MyDOS to see if that works better, but I don't have anything using MyDOS.
Try this. With ALL equipment off, connect the XF Cable to your parallel port and then your 1050. Start the floppy then the PC. Boot PCXf 3.5 or higher version. Be sure to have a bootable floppy in the 1050 at PCXf boot. Make sure you have the correct switched set on the XFormer command line. (C:\PXCF360\XFORMER -X -S -J dos25.xfd d2: ,. This SHOULD boot PCXf with AtariDOS 2.5 as D1: and your 1050 as D2: with the sound and joystick on. This is according to the PCXf 3.60 docs. If you don't have PCXf 3.60. Get it at http://www.emulators.com . It's free and has the docs included. I helps if you have an old version with the printed manual.

Hope this helps.

It certainly was not E.T.

By that time Atari's and Sears partnership was not as "cozy" as it
once was. I doubt any game had a 2 week lead at Sears, but if one did,
my guess is that it was Space Invaders.

I would like to get into the Atari 8-bit programming, but I have never owned one before and I am wondering what do I need? I don't like the 65XE/130XE keyboard (assuming that it is the same as in the ST series), so I'm thinking about the 800XL...

An 800XL is fine, but the 130XE would be easier to pop an extra 256K into. In
any case, start w/ a stock machine, but if your going to get way into
assembler, you will need an expanded machine.

If you already have a PC around, get a copy of APE which will make
your work easier since there will be no hassles w/ floppies. If you
dont have a PC you want at LEAST a DD drive like a Indus or USD 1050. Might
look into a MIO or Black Box.

There are some great assemblers for the 8-bit now, and some nice cross
assemblers for the PC that work good too. Depends on your style. Since I
can run the EXE right from the PC mirror w/ no transfers, it's been easier
for me to use a crossassembler on my 486.

>
>Thanks

The atr8000 is a nifty box that gives you a serial port, a printer port, and the ability to use higher-capacity floppy drives with your Atari. There was a 64k version and, I believe a 16k version. The 64k version can be used as either a 64k print buffer or a CP/M computer in its own right.

The manual has instructions for how to cable various types of floppies to the ATR... Including 8" drives! :-) The unit shipped with MYDOS, which can deal with enhanced- and double-density drives...

I'd offer more, but my ATR (and its manuals) is in Texas and I'm in Washington state. :-)

>defeats the purpose.)

Hello. Okay here's some relavent facts.

1) The 800XL's monitor port (5 pin DIN) has a composite video out and
a line level sound out put.

2) The 800XL's monitor port DOES NOT have Y-C or "chroma-luma" output
by default. There is a relatively easy mod that gives it this feature
though. I've done, but sorry I no longer have the info on how.

3) Those monitors you have may or may not support chroma-luma in the 9
pin port. If not, you must use the composite video input coupled with
the appropriate pin of the XL's monitor port. My guess is that the
monitors DO support chroma-luma.

4) You need to get some definative pin-out info on the equipent before
you too amitious about anything.

Cheers,

Jon

>you can just spend a few bucks on a cable from B&C or wherever.
>Let us all know if you zap something :)

As far as I know, the chroma-luma was not internally hooked up in the
stock 800XL. The 800 had it, but for some reason Atari didn't "wire
it up" inside the XL. I had to do a simple mod to gain that feature.
Did your XL have it already? Anybodyelse knopw any=thing about this?

Just wanted to let you all know that our WWW page can now be accessed in the following ways:

http://www.dgs.clara.net

or, if that doesn't work you can always use the old method:

http://home.clara.net/dgs

The first method is easier, but only works with new browsers (Explorer 3, AOL, Netscape 2 and above are OK). If you have an old-ish browser use the second format.

If you don't know who we (DGS) are, let me tell you. We supply Atari 8-bit Commercial and PD software, including Quick programming language, and lots of specialist software from the UK and Germany. We can ship to any country, and we can accept payments in US$. See our WWW site for all our catalogues, and free download demos of some of our products. No WWW access? No problem! E-Mail us and we'll E-Mail you the catalogues.

Dean Garraghty.

Hello,
My name is John Powell. I believe that I could help you in your quest for floppies for the Atari 8-Bit. I have about 400 or more floppies full of programs for my computer. I am willing to sell these if you want to make an offer.
I also have all kinds of hardware for the same systems that atari made. The list is really large but I have just about all you would ever need in hardware.

I am at a friends house here in South Carolina. I will only be able to use his email address til Sept. 11th. After that, you will have to contact me via snail mail at:

John Powell
10650 Galena Street
Dallas, TX 75228
or call: 214-327-8855

I will be waiting to hear from you.

The ATR8000 is a very old (very rare to my knowledge) interface for the 8bit that allows you to use hard disks, modems and printers. I am not sure if it could use a standard 5.25 IBM drive. I would look at some of the Atari 8bit HOME pages that Michael Current posts monthly. I think you can find all the information you need on ALL Atari hardware...

I have the following items for sale:

Epson LX-86 printer, 9-pin dot matrix, works and looks great. Includes Apeface parallel printer interface for connection to the Atari 8bit. Also includes extra ribbon. $22

Okidata Microline 182 printer. 9-pin dot matrix. The plastic cover over the DIP switches is missing, but the printer works. I've been trying to sell this thing for almost a year now. If it doesn't sell this time I'll probably donate it to Goodwill. Last chance, folks. $5

Atari software:

Flight Simulator II cartidge. Label torn. $5

Print Shop, in original box with manual and reference card. $5

Print Shop Companion, in original box, with manual and ref. card. $5

Print Shop, disk only. $3

Print Shop companion, disk only, $3

Print Shop Graphics Library #1. $3 each, I have two of them.

Print Shop Graphics Library #2. $3

Print Shop Graphics Library #3. $3

Note: the above 3 graphics disk include reference cards.

Christian Scenes & Symbols, graphics disk for Print Shop. $3

F15 Strike Eagle, in original box with manual. $4

Silent Service, in original box with manual. $4

Bank St. Writer, disk only. $3 each, I have two of these.

Atari BASIC cartridge Revision A. $3

Synfile+, in original box, with manual and reference card. $5

Syncalc, disk only. $3

Choplifter, disk only. $3

Letterperfect (400/800) with xeroxed manual. $4

B/Graph with xeroxed manual. $4

Books:

Inside Atari BASIC $3

I will consider trades for C64/128 software.

Prices do not include shipping. All prices are in US dollars.
I am in Dayton, Ohio.

imarkows@escape.ca (Erik) said:-

>Im playing this game on xformer emulator and im using joystick to
>steer the ship BUT how do I land to pick up pilots ,what key do I use
>or what?

Boy, does this question get asked a -lot-...! <smile>

Okay, fly along till you see a "blip" in your LR scope (right hand, middle
of screen) Line up the "blip" with the center of this scope, and keep head
-ing towards it. When you are so close, the LR will flash and beep rapidly.
At this time, press <L> to land. Then, it will say "Pilot in range" Press
<S> to turn your Systems off. The pilot will run up to your ship and pound
on the door. Press <A> to open the Airlock. Once he is onboard, press <A>
again to close the Airlock, then <S> to turn systems back on, then <option>
to take off... Have fun! :)

PS Beware! Not all pilots are all
that they appear to be...! :)

I'd guess it has 32K in it. fre(0) on a 48K or 40K Atari 400/800 (no
DOS loaded) returns something around 37902 bytes.

I'm new to the fabulous world of Atari 8 bit computing. I just acquired 2 Atari 8 bit computers about a month ago, and I've had fun ever since.Found some really helpful info in this newsgroup and on the web.I didn't realize the 8 bits still had such a big following. I just created my first web page http://www.geocities.com/TimesSquare/Lair/1378/atarishr.htm Feel free to check it out. It's not really much to look at, but I'm still learning about HTML. I would welcome any constructive criticism to make my web site better.Thankz in advanze :)

I think the extra card would just decode into the same space as the top 16k
of your 32K card.

>that much RAM on a 400 before. Thanks for your help!
>
I don't think any 400s were built with more than 16k, but there were memory
expansion boards which would give a total of 48k. After Basic and DOS you
would have about 29000 to 32000 bytes free.

>P.S. If I really do have that much RAM, does that mean I'll be able to run
>some neat programs on disk that I couldn't if I only had 16K? If so, which
>ones?
>
With that much memory, you can run anything that doesn't require an XL or XE.

1670. Amstrad in other newsgroup Shock

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-04 00:00:00 UTC
From: Brian@spheroid.demon.co.uk
Message-ID: <873398860snz@spheroid.demon.co.uk>
Source record: 70390
Cross-posted to: comp.sys.cbm,comp.sys.sinclair,comp.sys.c64,comp.sys.atari.8bit

Hi all,

Excuse this interruption from an alien lifeform, but it's all meant in
the friendliest spirit.

I live in the UK and belong to an Amstrad CPC user group who are having
a get-together (very informal) at the Bescott Football Stadium in
Walsall (near Birmingham) from 10am-4pm on September 14th 1997.

If users of any other computers would like to come along, you'd be very
welcome. We're all in the same ghetto, but some of us are looking over
the walls!

Ticket prices are 4 English pounds (or if you're really broke, just put
a contribution in the bucket by the door).

Transport may be possible on a "shared expenses" basis if you're in need
or can offer places.

If you'd like further details e-mail me at:

brian@spheroid.demon.co.uk

Steven J. Tucker (ai123@FreeNet.Carleton.CA) wrote:

: There are some great assemblers for the 8-bit now, and some nice cross
: assemblers for the PC that work good too. Depends on your style. Since I
: can run the EXE right from the PC mirror w/ no transfers, it's been easier
: for me to use a crossassembler on my 486.

What cross-assembler do you use? What're the requirements to run it?
Do you run APE and the xass. at the same time (swapping between the two
or multitasking)?

Thanks! :)

1673. Emulator game CDs from the UK

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-04 00:00:00 UTC
From: Rocketship Services <rocketship@dial.pipex.com>
Message-ID: <01bcb97b$984f96c0$47fc82c1@dh69>
Source record: 70393
Cross-posted to: alt.binaries.emulators.cbm,alt.binaries.emulators.misc,alt.binaries.games,alt.binaries.mac.games,comp.sys.atari.8bit,comp.sys.atari.st

COMPLAINTS: see 'NOTES' section below.

EVERYONE ELSE:
Ever wanted CD backups of your legitimately-owned software for protection or to use with emulators, but been wary of sending awkward sums of money to dodgy-sounding geezers in the USA?

NOW - send awkward sums of money to dodgy-sounding geezers in BRITAIN!, with the added security of Recorded Delivery! Yes!

Why spend endless hours downloading at horrendous BT rates? (To download the entire contents of the Mega Drive CD, for example, even if they were available - which they're not - would cost over £122, rising to nearly £300 if you were
daft enough to try it in the daytime. Plus, of course, you'd have to physically sit there actually doing it for around three weeks rather than just
sticking a stamp on an envelope and waiting a bit).

When on the other hand, you could buy the CD from us for half the price of one new game and SAVE AT LEAST £100 on the cost of the calls alone, plus the COLOSSAL AMOUNT OF TEDIOUS EFFORT.

We now have available a number of CDs packed full of classic games for your entertainment and peace of mind. Prices listed are for (1) UK delivery, (2) delivery within the EC (including most of Eastern Europe and the Irish Republic), and (3) other overseas delivery (Australasia, Canada, USA etc), and are for Air Mail service, with (International) Recorded Delivery for added security.

All 7 CDs £120 - save £28 (EC £130, Non-EC £135)

For ordering details or more info, contact us at
rocketship@dial.pipex.com

Thank you for your attention.

NOTES:

1. All prices include Recorded Delivery within the UK, or Air Mail and International Recorded Delivery for overseas addresses. Delivery is within 14 days of receipt, to allow for cheque clearance etc.
2. All games are in emulator-compatible formats. (All files are also unzipped except C64, Mega Drive and SNES, so you can run games directly from the
CDs without having to take up hundreds of Mb of hard drive space.)
3. Particular games may not work on current versions of emulators.
4. This is solely a back-up service for legitimate owners of the software included on these CDs. If you do not own an original copy of any of the games, you are expressly forbidden by copyright law to make ANY use of the copies of those games on the CDs. So don't do it.
5. Rocketship Services accepts no responsibility whatsoever for illegal or inappropriate use of the contents of these CDs.
6. No emulators are included on the CDs.
7. The prices listed above are to cover the costs of raw materials, equipment, time and secure postage. If you think they're excessive or profiteering, feel free to try doing it yourself cheaper.
8. It is the opinion of Rocketship Services that all the formats and titles listed
above are commercially dead, and that the sale of these CDs imposes no financial loss on the copyright holders. No correspondence on this subject will be entered into.
9. Any order of CD(s) will be taken to imply full acceptance of these terms.

Should run fine with the same power supplies that run the 800 & 810.

1675. Game Link II questions

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-04 00:00:00 UTC
From: Jeff Potter <jdpotter@worldnet.att.net>
Message-ID: <5unmsb$b5r@bgtnsc02.worldnet.att.net>
Source record: 70395

Bill Kendrick (and the rest of the gang),

I've been looking over my source code to Maze of Agdagon. The Game Link II protocol was a little like Bill Wilkinson imagined it was. Every 1/60th second, the Host node sends out a message to one of the other nodes (or itself) telling that node "after you receive this, broadcast your telemetry to all of us." Then the Host and all other nodes would sit back and listen for it. Each node could transmit to all others. The Host would rotate which node to select each "jiffy" and so all 4 or 8 would be covered in a short amount of time. Each node would send back a 4 word packet, describing all relevant information, including a one-bit "I am/am not done drawing the last picture yet." After all nodes told the Host they were done, the next jiffy the Host would send out a "all right everybody, swap your display list pointers, and show your pictures; start drawing the next picture with the new telemetry."

The Host would time out on any node which never answered, and eventually would stop waiting for its handshakes (try it sometime, you can unplug any other node, and the others will continue on until you plug him back in). It would also reconnect once-missing nodes. Although something would eventually go wrong during long 4-player sessions, and the Host would lock up.

Unlike most serial routines, MOA's were designed to run in the background, so the main program didn't just "sit and wait" for the serial transmission to occur. There was some handshaking between the main loop and the interrupts, as would always be necessary.

So I put it to you: if you want help from me, what kind of activity do you plan for the interrupt service? Will you have a fixed packet size? Can it have a known location in memory, which the interrupts just grab and then perform a handshake with your main routine? Or would you want the messages sent on the serial bus to be entirely on demand, where your main routine "sits and waits" for a handshake line to be cleared? What do your receiving nodes do?

You must code your output complete and input ready routines in assembler or something fast. If you don't read a serial input buffer before the next bit comes over the SIO bus, the data is scrambled and a framing error is reported. Similarly if you send data out and don't wait for it to be shift out correctly before you send another word, it will get scrambled. POKEY isn't as forgiving as the modern UARTs with FIFOs!

Jeff Potter

1676. New Lower Prices! Atari!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-04 00:00:00 UTC

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.

Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest

to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

I want to get rid of the follow items. I need room in my basement.

Intellivision - All are in original box, have manual and 2 overlays
unless noted.

Advanced Dungeons & Dragons - No manual
Astrosmash
Las Vegas Poker & Blackjack
Major League Baseball
NBA Basketball
Space Armada - Manual cover is ripped
Sub Hunt
Demon Attack
Swords & Serpents

Take all Intellivision items and shipping for $40 OBO.

Atari 8bit

MPP-1000C 300 baud modem with original box, power supply, owner's manual
and smart terminal cartridge (PCB is loose). Plugs into joystick port.
Cost: FREE. Just pay for shipping: $3.00 for USPS 2-3 day priority
mail.

Atari 1027 Letter Quality Printer with original box, power supply, SIO
cable, owner's guide, oil, extra ink roll. $20 + 6 shipping.

Compute's second book of Atari, 12/86 Antic, Atari 8-bit extra from
ANALOG. $7 + 3 shipping.

Write for details.

Actually, I'm not sure if Broderbund truly absorbed Synapse or if Synapse simply sold the rights to specific products. I talked to Steve Hales (Fort Apocalypse, Slime, Dimension X) for "Halcyon Days: Interviews with Classic Computer and Video Game Programmers," and he almost made it sound like Option B. The "specific products" would have included the interactive fiction products Synapse was working on.

The Halcyon Days URL is http://www.dadgum.com/halcyon.html, BTW.

>Atari computers.

A cross assembler will emit exactly the same code as an assembler running on the Atari. Assembly language maps 1:1 to machine language, so whether or not the assembler is running on the same CPU type as the target CPU is irrelevant.

Perhaps you were thinking of compiled C... once again it doesn't make a difference whether the C compiler is a crosscompiler on different hardware or a compiler running native on the Atari. All that matters is how good its code optimization is. (This would tend to favor the cross compiler, which will have more memory and CPU speed resources to throw at the task of optimizing.)

Perhaps you were thinking of C versus assembly. I have hand built several computers using the 68HC11, an 8-bit microcontroller with an instruction set fairly similar to the 6502. I tend to program them in C exclusively, because it's not critical to wring the maximum performance out of the 68HC11 for the things I'm doing. The difference in efficiency between C and assembly for the 68HC11 is not even close to 20 times.

Crossplatform development is probably a good way to go on the Atari at this time; at the very least you get to use a nicer text editor, display, and disk, and a faster CPU to assemble or compile the program.

94>forever. I remember some old type in listings in COMPUTE used to use the
94>^ function as pauses instead of using empty for/next loops! heheh

Yikes, I never heard of that one. I was trying to decifer some of the assembler source for these routines, contained in a Compute! book about Atari BASIC, and written by the OSS guys. Maybe I should just ignore it. :-)

So far the best I can get with finding the square root is to use the n^0.5 formula. I've found references to the Newtonian method of solving it, but it seems as if that method is a shot in the dark, and would take too much processing time to be practical.

The SIN, COS, and ATN stuff is another story. Based on what I'm rediscovering about trigonomety, finding the SIN, COS, etc requires knowing two things about a triangle, so how can a function with one input parameter solve the problem when all the math books say you need two!? :-) Obviously I have more reading to do.

I'm also writting my own floating point package to access the Atari OS floating point routines. I find REAL.ACT to be akward, and the Toolkit documentation is a little abstract about how to use the functions.

Later...

Well, scoring and a simple high-score system have been added, the graphics
for the character that you play are done (he looks upset when the screen
gets really full, then returns to happy as you make the screen safer),
and the simple "game over" and "next level" effects are done.

I just tried compiling it with the standard Action! runtime library,
but unfortunately I got an error 61 ("out of symbol space") :)
Looks like I'll need to trim down my mass collection of global variables. ;)
I'll also be stripping unused stuff out of the Action! RT library, as
well, to save Symbol space as well as (and most importantly) saving RAM.

It's a very playable game. There are currently 20 levels. At level 15,
the game changes slightly (4 more objects to deal with, making getting
matches a lot harder!)

Honestly, I couldn't beat level 15 at ALL until I tweaked it to make
it a little easier. I was impressed at how difficult it got all of
a sudden. :)

For a rundown of ALL the game details, check the website!

http://zippy.sonoma.edu/kendrick/nbs/atari/games/gemdrop/

Enjoy!

Umm.. err... uhh... duh.. :) Let me think. The latter seems simpler,
and sufficient for what I imagine my first project being. (Perhaps,
as a test, a 2-player 2D maze game.)

: You must code your output complete and input ready routines in assembler
: or something fast.

Fortunately, I'm learning 6502 assembly (finally!)...

: If you don't read a serial input buffer before the next bit comes over
: the SIO bus, the data is scrambled and a framing error is reported.
: Similarly if you send data out and don't wait for it
: to be shift out correctly before you send another word, it will get
: scrambled. POKEY isn't as forgiving as the modern UARTs with FIFOs!

Well, even in Action!, even >I< can write interrupts. :)

I learn best from example (and stolen code). Could you (or someone)
provide assembly language code which, for example, does this:

Send the value of my STICK0 to the other computer
Receive a value from the other computer and, I dunno, set the border
color (COLPF4) to that value

So, my joystick would control the other computer's screen, and vice-versa.

No protocol stuff.. just bytes of data.

This simple example would be the best way, I think, for me to learn this.
I could be wrong, but when I learned to do MUX programming stuff,
the first thing I did was port the chat program to Action! to get used
to how the code worked.

Thanks! And thanks for your time so far, Jeff! Very much appreciated!

-bill!

: owned one before and I am wondering what do I need? I don't like the
: 65XE/130XE keyboard (assuming that it is the same as in the ST series),
: so I'm thinking about the 800XL...

The 130XE keyboard is nothing like an Atari ST keyboard. The XE has much more substance behind it when you strike the key. I do find that it lacks a certain sensitivty to keystrokes though. The best 8-bit keyboad I have used was on the 600xl. Very sensitive to the touch without being totally wishy-washy.

For doing programming you'll need to decide whether you want to suffer with Atari BASIC, or else get something with a little more kick. Turbo BASIC is a good freeware version of the BASIC programming language, and darn fast to boot. There's also lots of PD assemblers, and at least two versions of C. CC65 seems to be a very thorough version of C but it's big, and seems to be lacking high level function libraries. None the less it produces real executable files, rather than pseudo compiled code that Turbo BASIC does. The UMICH archive has lots of programming files in the 8bit\languages directory you might want to look there.

If you can get you hands on it, there's also the language products produced by OSS. MAC/65, BASIC XL/XE, and ACTION!, are all excellent programming languages. BASIC XL/XE currently lacks a proper compiler though. I've heard mumurs about a runtime package for BASIC XL, but I've never actually found a copy of it. ACTION! is pretty nice, it's kind of like PASCAL, the authors say it's got a bit of ALGOL in it too. Only frustrations I've had with it so far is that the floating point routines in the Toolkit are a pain, and don't include support SQR, COS, SIN, ATAN. Which normally you need Atari BASIC running to access. This isn't a big problem since one can write their own function library as a replacement. ACTION! produces real executable code by including a runtime source code file along with your own program. MAC/65 is a very well done macro assembler, which includes a built in debugger. Very fast, only draw back is that the editor uses line numbers. Assembler lets you be the ultimate control freak with the machine, but it's a lot of work juggling memory with the three main registers in the 6502. 16 bit integer math is a real trip when first learning how to do it. Of course with a macro assembler, once you figure it out, you just write a macro for it to automate things slightly.

Okay so finally you'll need some specs on how to program the dang thing. If you can get it Mapping The Atari is a must have book. If you can't find that, the System Reference Manual which is available on the World

Wide Web is a very excellent substitute. The rest is dependent on which programming language you want to use. I can recommend many different books on the topic of assembly, and BASIC programming. You should also take a peek at the new ANTIC Magazine Online website which is carrying reprints of one of the great 8-bit magazines.

That should help you get an idea for what you'll need for programming the 8-bit.

Hope this helps...

TTYL...

Cross-assembled code takes up the same amount of space. Did I say anything
about using C? A poor response, IMHO.

I use a table driven assembler called TASM, a very nice package. You can
get it at simtel in the msdos/crossasm directory as tasm301.zip. It
includes tables for other processors, and has some pretty nice features.

It really small and fast, I bet it would run on even a 8088/286. The registered
version w/ manual is still available, and its well worth the cash. If
i'm working on something I usually just shell out of APE to an editor, make
the project, exit and try it out.

Makes things alot easier to debug imho since the turn around time on changes
to the code is less than 10 seconds from start of compile to actual testing.

Brian, thank you so much for your multiple informative postings to all of these newsgroups. Without people like you, we would have absolutely nothing to talk about here.

The problem was obviously not with your mailer/reader since each reply you sent out was different. That means you must have typed in each reply.

Ok, so do you have anything constructive to add to any of the discussions going on in these newsgroups? You must have some questions...maybe you're too shy to ask. Since you are acting like a newbie, I'll point you in the right direction. There are several newsgroups (even books by now) which discuss newsgroup etiquette, try news.newusers.questions, news.announce.newusers, news.groups.questions, or even news.answers.

Good luck. Sheesh!

This incredibly asnine and ridiculous post was completely unnecessary
and certainly makes "cowpoke" out to be a jerk of the highest order...
Mr. Watson had nothing but the highest intent in posting his
invitation to the various newsgroups - a sanctimonious group thrashing
such as this is simply ludicrous. At best you should have vented your
spleen by e-mail instead of on Usenet.

Frankly Mr. Cowpoke, I found your one bilious post to be much more
odious than the errant posts of Mr. Watson...

Amazing isn't it? That an entire platform's files fits into a ZIP disk....

Is this the A8 files only, or 16bit too? Is this every file uploaded to CIS _ever_, or do they remove old files after some time?

> I would really like to get a single file or three to simplify
> and speed backing up.

Perhaps I can help? I have a ZIPper on my Mac that I find to be much more reliable than the ones on the PC, notably on large files like this.

Thanks for the defence, but don't bite his head off.

It was MY screwup.

Though a frequent poster to other newsgroups for a year or so, I had not
used the "multiple" option before as I had never had the need to.

Therefore I didn't know that everything was being echoed and echoed until
it happened the first time, and happened AGAIN when I tried to apologise
group by group.

Aargh!

From here on I am strictly sworn off the "multiples" option (I hope).

> defeats the purpose.)

This has probably already been said, but -- that seems to be INCREDIBLY
ROUNDABOUT.

For one thing, the "composite out of the Atari," is just that:
composite. What
YOU'VE described doing WITH "the composite out of the Atari," suggests
that what
you REALLY took out of the Atari was "RF," NOT "composite."

Composite video, perfectly ready to plug DIRECTLY into the RCA "video"
jack on
the back of your 1084 / 1084S monitor, comes right out on that 5-pin DIN
thingie
you're talking about (unless you're using an Atari 400, which I believe
lacks
some or all of the outputs other than the "TV/RF").

I don't know the pinout, myself -- but on the other hand I've always
done it by
trial-and-error MYSELF, and have never blown up a monitor by so doing.

On the other hand, I do have an ulterior motive for responding here
today, which
is this: my 1084S DID give up the ghost (though NOT, I assure you, as a
result of
being (mis)used with the Atari!) and I desperately want to REPLACE it.
Anybody
have one for sale??? I'm going to be posting a message to that effect
to misc.
wanted and a couple of other places, shortly, but thought I might as
well mention
it while we're already on the subject. Thanks in advance for any
responses (e-mail
if you can, even if you also post; my news-reading interface here is
flaky at best

and has been WORSE than flaky for the past two or three weeks. I rarely see even
my OWN articles, let alone the FOLLOWUPS to them. I'll happily return the favor
if YOU should happen to request it of me someday).

Just to pound one more nail into the coffin of fine-scrolling...

On the 400/800, any "fine-scrolling" would have to be implemented by the user, doing his own ML/assembly programming. That program would indeed have to set the "enable vertical fine scrolling" bit in every Antic opcode in the Display List. The program would then ALSO have to reproduce the E: device's "scroll text" behavior, adding code to stuff successive values into the "vertical fine scrolling AMOUNT" register before, or should I say BETWEEN, the standard operation of "shifting all the display data in memory by 40 bytes." In short, as in so many areas, the hardware capability was there, but the OS didn't take advantage of it.

On the XLs and later, though, the OS -- the E: device, specifically -- was modified so that it DID take advantage. If the crucial bit at address
652 is CLEAR when a GR.0 command is issued (the E: device is OPENed), the
new-and-improved E: device builds the "same old" Display List as on the earlier (400/800) computers, and performs "coarse-only" line scrolling as
in those earlier machines. If, however, the crucial bit is SET at that time, the new E: device builds a DIFFERENT Display List -- one byte longer,
as someone has said, for technical reasons I could explain if I had more time, and with the "vertical fine-scrolling enable" bit set -- and then performs the additional fine-scroll-amount successive-value-stuffing opera-
tion I described earlier, IN ADDITION to "old-style" or "coarse" scrolling.
I.e, on the newer machines the custom programming has been done FOR us, is
incorporated into the E: device, and as a result "the OS supports the hard-
ware's vertical fine-scrolling capability" in this case.

Questions that this suggests, whose answers I DON'T know, are:

- we know that the new-and-improved E: device "fine-scrolls" when e.g. we LIST a BASIC program; that is, when lines scroll UP. But I've never
noticed whether it also fine-scrolls when lines scroll DOWN, for in-
stance if you hit a bunch of SHIFT-INSERTs in the middle of a screen.

- Does the E: device's built-in fine-scrolling apply only to GR.0? Or would/does it also fine-scroll in the 4-line "text window" at the bot-
tom of the "graphical" GR. modes?

Have to run,
Chris Chiesa

I just wanted to take this opportunity to thank the 295 people who have visited our Atari 8-bit Web site between 01-Aug-97 and 04-Sep-97.

However, out of these 295 visits, we have only received TWO orders. That's an order rate of a mere 0.67%. This is very surprising. According to our access log summary, 42 people have taken our ZIP file containing all the catalogues, 72 people have taken the main catalogue as a text file, 99 people have taken our 'used' list as a text file, 37 people have taken a list of PC CD-ROMs we have for sale, 46 people have requested to see information on our AMS 96 show video, and 13 people have downloaded the free product demos.

Surely out of all these people SOMEBODY wants SOMETHING??!!

One thing that really surprises me, is the fact that many people visit the site but then leave again without looking at any price lists, or downloading anything. I can't understand this at all?! How can folks decide we haven't got what they want when they haven't even seen what we have available?! I can only assume people leave because the site looks a bit boring. The sole purpose of the site is to allow people to have easy access to our catalogues whenever they want them. If you want nice pretty pictures and such like, you'll be disappointed!

In case you don't know what we do for the Atari 8-bit, here's a brief summary:

We sell PD and Commercial software for the Atari 8-bit, along with a variety of used hardware, software and magazines.

We have English language distribution rights to all Power Per Post products, including the QUICK programming language and Screen Aided Management 80 col. desktop system. We also distribute software on behalf of Rambit UK and Richard Gore.

Our 80K catalogue lists all 190+ PD disks and details all our Commercial software.

The list of used items is also available on the WWW site.

The catalogues are available as individual text files, or as a combined .ZIP file for easier downloading.

Demos of QUICK and Digi-Studio are also available for download from the WWW site.

We can ship to any country, and can accept payment in US$ at no extra cost to you. See the catalogues for full details.

> versions of the classic arcade games and updated them to take
> advantage of the increased capability of the XE-class machines?

Some of those games, though, already seemed to be pushing the limits of the hardware. Joust, for instance. That the programmer managed to get so many birds on the screen was impressive in itself.

I did wonder why Atari kept re-releasing their classics though. How many times were Super Breakout and Missile Command released? They came out for the 800 around 1980, for the 5200 in 1982, for the XEGS in the mid 80s. Did anyone care anymore? Sega's getting the same way with Afterburner and Space Harrier.

Source record: 70422

Hi,

X11??? Well X11 is a means by which an XWindows terminal can remote host into another (or a simple PC using a program such as Exceed use to Xterm)

Perhaps you mean an XC11 which was the first version of the Atari XE tape cassette recorder, there was a limited release of the XC12 cassette recorder as well

You might also be referring to the XC1411 which was a 14" color composite monitor that
Atari had designed and has shown at the 1985 CES but never sold. There are several of them floating around.

Curt

>Thanks...

Hmm...how are you shipping that? I think its a little high. Let me give you
an example. I just shipped a 46 pound monitor (including packaging) about
3/4's of the distance you mention via UPS Brown label and the total cost
INCLUDING the COD-CASH charge was $16.61... :)

Yes. In fact the interface was removable and interchangeable.
Okidata sold them seperately too, in case you switched computers or
something.

Brent

1708. Atari 8-Bit Computers: Frequently Asked Questions

13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?
13.7) Which versions of the Operating System (OS) are there?
13.8) What games support 4 simultaneous players on the 400/800?
13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?
13.10) What is Omnimon?
13.11) What is the difference between NTSC and PAL machines?
13.12) What programming languages are available for the Atari?
13.13) What is the Atari XEP80 Interface Module?

Other FAQ Lists for the 8-bit Atari
14.1) What vendors, developers, or publishers support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) I'm new to the Atari. How do I use this thing?
14.5) Can I use an emulator to run my old Atari software on my new computer?
14.6) What hardware upgrades, modifications and add-ons are available?
14.7) What is the HARD-Interlacing-Picture (HIP) format?
14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

Reader-suggested topics, unwritten as yet: (volunteers?!)
How fast of a modem can my Atari display keep up with?
-with Ultraspeed roms?
-with XEP-80
-with any particular terminal program

Video Upgrades
-Adding chroma\lumi to 800XL

How can I make my commercial boot disk (cart)
into a load file or disk image?

What is APE?

Why does some European software (especially demos) flicker?

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit
computers.

1972
Atari Inc. is formed by Nolan Bushnell; created the first coin-operated arcade
video game with the introduction of Pong. The video game industry was launched
and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), giving birth to home
video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using
the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400,
"Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now

heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing direct memory access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Today Atari Games is an indirect, wholly-owned subsidiary of the Midway Games division of WMS Industries.

WMS Industries Inc.
3401 N California Ave
Chicago IL 60618-5899
USA
http://www.wms.com/

Midway Games Inc. (a division of WMS)
http://www.midway.com/

Atari Games Corporation (a subsidiary of Midway Games)
http://www.atarigames.com/)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of direct memory access.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS Corp. subsidiary.
JTS Corporation, with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer market. JTS offers an innovative line of ultra-slim 3.0-inch disk drives that provide higher capacity and lower cost per megabyte than competitive alternatives in the portable computer market. The president and chief executive officer of JTS, Tom Mitchell, was formerly the president and chief operating officer of Conner Peripherals and co-founder, president and chief operating officer of Seagate Technology.

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer...

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12 ++	Char	40 x 24	5
5	13 ++	Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14 ++	Map	160 x 192	2
D	7	Map	160 x 96	4
E	15 ++	Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9 +	Map	80 x 192	1 **
F	10 +	Map	80 x 192	9
F	11 +	Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following text was written by Chris Crawford and appears in De Re
Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a (PIA). However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

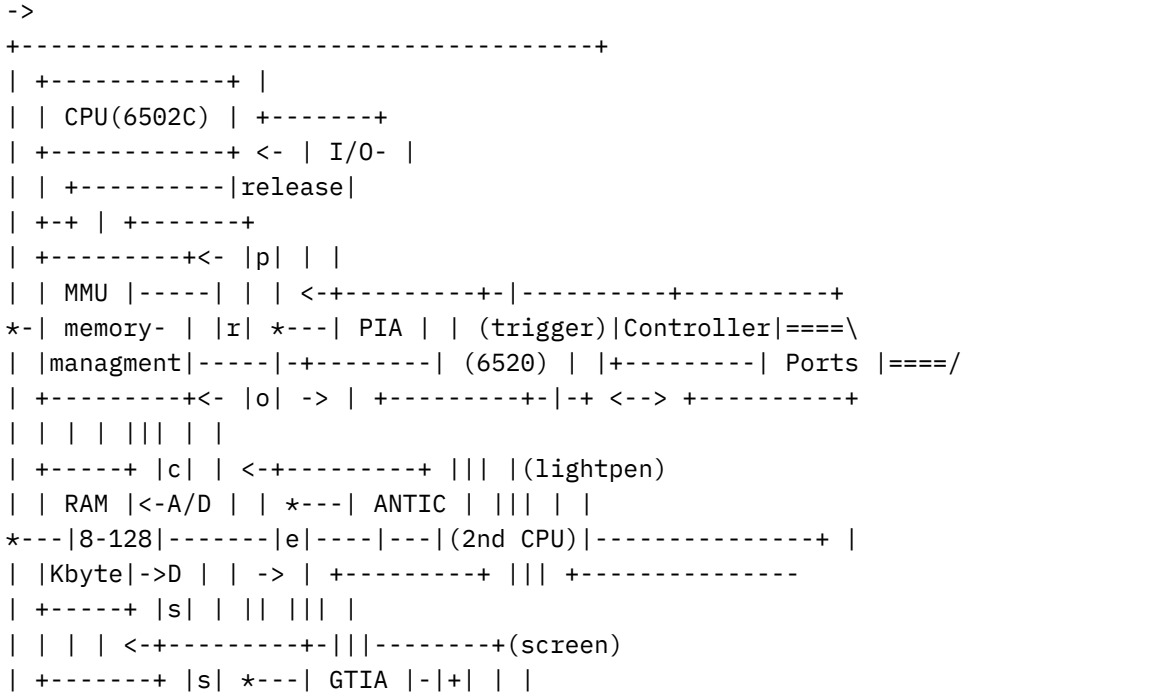
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missle graphics, and collision detection.

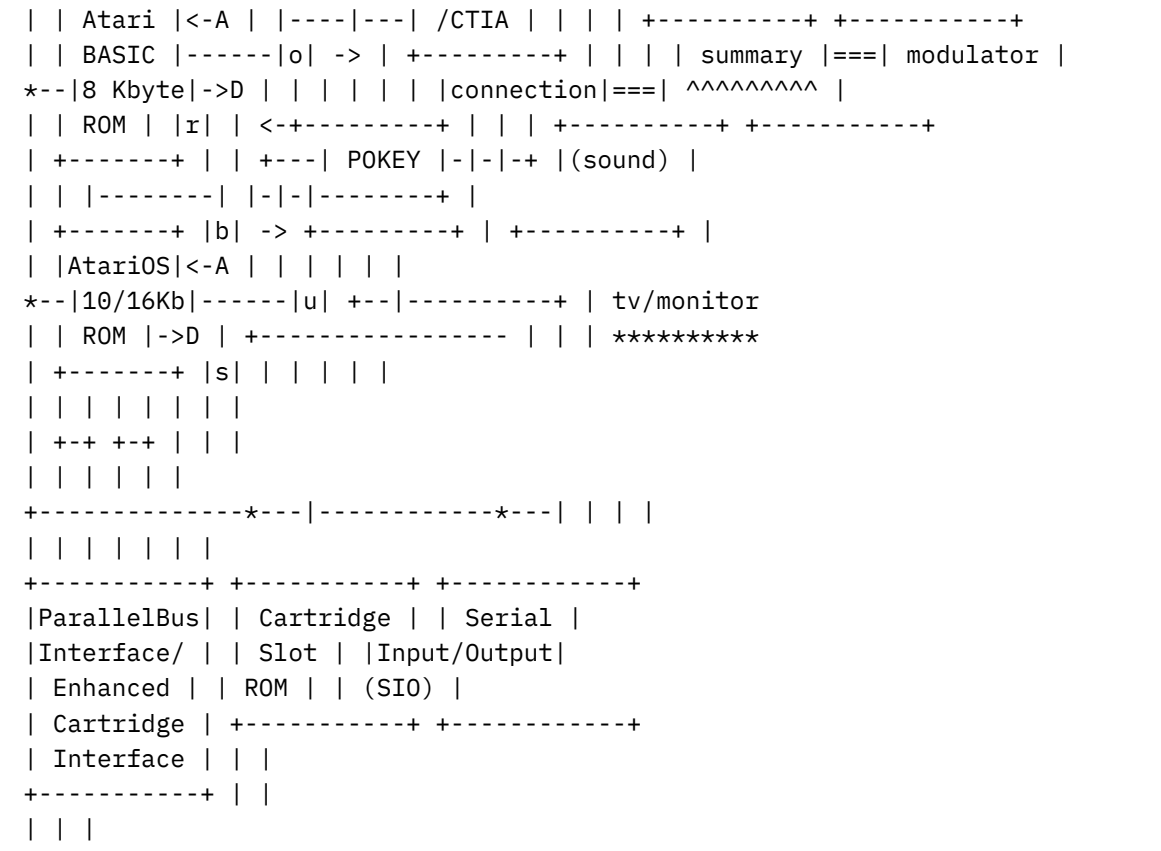
POKEY is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@closer.brisnet.org.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.sb.sub.de (Peter))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800:8/16/48K,1200XL/800XL/65XE/800XE/XEGS:64K,600XL:16K,130XE:128K
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the

University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Opinionated discussions about Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements related to Atari computers. Dead newsgroup?
Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming Atari computers. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

INFO-ATARI8 is moderated by mailto:snyder10@MAILHOST.TCS.TULANE.EDU (Mike Todd)

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.2) What is the Independent Atari 8bit Network?

Date: Fri, 29 Nov 1996 10:37:26 GMT
From: mailto:tomhunt@bright.net (Tom Hunt)

Closer To Home Enterprises is happy to announce the grand
opening of the IA8N's QWKNET. IA8N = Independent Atari 8bit Network.
This network is ran by a group of volunteers that are dedicated, hard
core 8bit owners.

I am seeking more individuals to join the network.
Individuals who join this network will receive weekly, or biweekly QWK
packets through internet email. These packets contain messages from
member 8bit bulletin boards and from individual members of the
network. These packets are ARCed and UU enocoded. Both ARC and UU
encoders are readily available for almost every type of computer
system, including the Atari 8bit.

Highlights from recent message threads include:

A member's recent pilgrimage to Poland to meet with
various developers. He reports about a new IDE interface
and Sparta Dos X clone for the 8bit.

Discussions about the new HIP graphic format. Announcment
of the release of the new HIP slideshow program, and
where to download it.

Discussion about David Hunt's (no relation) release of
Carina 2.7 into shareware, and where to download it.

Discussions about how to use the 8bit to access the internet,
including hot 8bit places to visit. There are tips about
which lynx servers are the best to use, how to do dns lookups,
and free telnet bbses.

Discussions about Larry Black's soon to be released ZSEND
program.

Message bases that are currently available are:

General
Internet
Programming
Hardware
User's Groups
Whine Base
Recipe
Pets

When an individual sends back a REPly packet to the network,
ARC must be used for compressing the packet. But UU, HEX, and MIME
encoding of REPlies is allowed.

The message bases have thousands of messages, many of which
contain information and references to programs that cannot be found
anywhere, even on the internet. So join the QWK Net today. This is
a FREE service to the 8bit community. Ask about a sample QWK packet,
so that you can see for yourself.

Send inquiries to: mailto:tomhunt@bright.net

"QWK Net, an Atari 8bit network, 100% managed, maintained, and
published via internet email on an Atari 8bit computer."

Subject: 3.3) What is the Classic Computers List?

The Classic Computers List is a discussion list for people who
collect/preserve/restore old computers of any kind. If you would like more
info you can find it at http://weber.u.washington.edu/~bcw/ccl.html .

If you don't have access to the web, then send an e-mail to
mailto:bill@booster.u.washington.edu (Bill Whitson, ClassicCmp ListOp).

On the web site you'll find information on how to subscribe in addition to the
two ClassicCmp FAQs. If you decide to subscribe, please read all three
documents first.

Subject: 3.4) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.5) What is ATARI8-L?

To subscribe, you should send the message for
mailto:majordomo@zwieracz.psych.uw.edu.pl with the line:

subscribe atari8-l <your mailing address>

in the body (not the subject) of the message.

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:kendrick@zippy.sonoma.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich Archive. The Archivists request you use these mechanisms in this order of preference:

1) The number one way to get into the UMich archives is via AFS. If you have AFS, all our files are kept in the directory "/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT! Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/
gopher://gopher.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu/atari/8bit

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/ Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

A mirror web site:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory. Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/ (<-- RECOMMENDED)
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://ftp.toad.net/pub/umich/8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You might also suggest what permanent 8bit subdirectory you'd like your file to end up in.
- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to have seen no uploads for years, but there are some files here that aren't on any of the other sites. [IS THIS SITE LOST? - 10/13/95]

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Slovakian Archive?

This FTP site contains some demos, games, utils, zines from all the world.
Here you can also find some Slovak or Czech stuff.

Contact: mailto:mchorvat@econ.umb.sk (Marco, of GMG)

ftp://svs.scsss.sk/pub/atari/

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British
Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:76702.1076@compuserve.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; excellent for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No

Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
filename: ?????

Ice-T XE v. 2.72 (128K) or Ice-T 1.1 (48K) by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.7 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.7 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.7 XE) or No (1.1)
Summary: Excellent for high-speed VT100 emulation

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it

]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:conradus@plearn.edu.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format

disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin

port.)

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go from
#1 on the right to #13 on the left on the 'long' side
and from #14 to #25 from right to left on the 'short'
side. #25 is closest to being under #13. A male
connector is the mirror image of this.

Most terminal programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about
30 feet long, is to use two female DB25 connectors and
some three or more conductor cable. Using the two DB25
female connectors allows unplugging your modem and
plugging in the null modem cable. This also avoids the
confusion of the wide variety of serial port jacks on
different computers. Almost all computers connect into
the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An
850 Interface Module, P:R:Connection, Multi I/O, Black
Box (by Computer Software Services) or similar device
that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock

8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 11.5) What is SIO2PC?

Original text by Dave Paterson, mailto:davepat@total.net

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la US
Doubler).

All these functions are transparent at the Atari end; you never notice the
difference between SIO2PC and regular drives, except that the SIO2PC drives
are faster than any others (except Ramdisks and PBI interface drives).

Several different designs for the SIO2PC hardware are floating around. Best
contact the author for the latest details.

SIO2PC 4.13 is shareware by Nick Kennedy, mailto:nkennedy@cswnet.com

---

Subject: 11.6) How can I convert my commercial boot tape into a cassette
image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a
way to store all software that has been recorded on cassette tapes on
the hard disk of your PC. I have written a program that is similar to
the SIO2PC utility written by Nick Kennedy. But this one is intended
for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free
disk space to work with. The sound card should be able to sample sound
at a sample rate of 44.100 Hz mono. The sample must be recorded into
a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file.
The .cas file is a digital cassette image file that only contains the
data that is on the cassette tape. Once you have that, you can throw
away the .wav file. The .cas files are typically 16 to 64K, so they
are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette
image) you do not need a sound card. You do need a SIO2PC cable or
similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives
of Umich by now. They have been put together in one zip file
wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file
format as of version 1.15 of APE. It looks real neat, so try that out
too! Thanks to Steven for adding a nice user interface for these
cassette images. He did a nice job. I am hoping other using are
willing to write some programs to get more enjoyment out of this
underrated storage medium.

My stuff is available totally free for personal use, so I hope you
enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,

chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps

CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps

- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF351 or XC35
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (76702.1076@compuserve.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch
Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus
separate chroma (color) and luminance (brightness) signals which the best
composite video monitors can take advantage of. Popular examples of such

monitors include the Commodore 1702 and 1804 (and many others).

The pinout of the Monitor port is in the pinout section of this FAQ list.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the 800XL lacks separate chroma/lumi (can be added via hardware modification)

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\lumi signals

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/developer list). SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions. 410a - Taiwan version
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors

1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink software. 2 SIO ports
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, w/ XE Term software. Permanent SIO cable
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
600 600XL, all black case
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" floppy drives
1450XLD 1400XL plus 5.25" floppy drive
1600XL ????
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -Z-80 CPU, 64K RAM, CP/M 2.2 OS, 80 column display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
========================

6 V DC 300 mA (1.8 W) Atari#??????? adapter:
"410P" (vaporware)
9 V DC 200 mA (1.8 W) adapter:
MPP1000C (the modem from MPP, interfaces via a joystick port)
9 V DC 500 mA (4.5 W) Atari#CO16353 adapter:
XEP80,SX212,2600
9 V DC 500 mA (4.5 W) Atari#CA014034 adapter:
XEP80,SX212,2600
9.3 V DC 1.93 A (18 W) Atari#CO18187 adapter:
Indus GT,5200
11.5 V DC 1.95 A (22 W) Atari#CA019141 adapter:

Indus GT,5200
5 V / 12 V DC 1.1 A (5.5 W / 13.2 W) Atari#CO62297/DV1450 adapter:
1400XL,1450XLD

E U R O P E (and elsewhere?) INPUT = 220 V AC, 50 Hz
==========
5 V DC 1,8 A, #CO61763-107: 800XL
5 V DC 1,5 A (7,5 W) #CO61763-34 : 800XL (U.K., 240 V AC in)
5 V DC 1.5 A (7.5 W) #CO61763-11 : 65XE,800XL,800XE
two ones with the same part number, but different cases and different
input Values :#1, 65XE (Poland, made in Taiwan), Input 22 VA
#2, 800XL, Input 26 VA
9 V AC 27 VA (3.0 A) CO60592-34 : 1050
9V AC 0,5 A, CO#61516 : 1010
9,3V AC, 1,66 A CO# (not printed), FW 6799: 800

These draw their power from the SIO +5 V:
XM301 (60 mA),XC12,ICD/FTe P:R:Connection

Draws power from the 600XL PBI:
1064

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

The power supply requirements for the following are still needed:
??? V DC ???? A (???? W) Atari#CA060535 adapter:
835

XC11 program recorder (no brick needed -> internal or SIO source?)

OTHER:
The ICD/FTe Multi I/O (MIO), all versions, can use both AC and DC supplies.
But stick to voltages of at least 6.2-7.2 V.

Subject: 13.4) What are the pinouts for the...?

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very

popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a product of Shadow Software. See the Vendor list.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:offen300@hio.tem.nhl.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:offen300@hio.tem.nhl.nl

The following Operating Systems exist for the Atari 8-bit:

Rev. System(s) Models Size Part Nr(s)
~~~~~~ ~~~~~~~~~~ ~~~~~~~~~ ~~~~~~ ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
A NTSC 400/800 10kB CO12499B, CO14599B, 12399B (*)
A PAL 400/800 10kB CO15199, CO15299, CO12399B
B NTSC 400/800 10kB (?)
B PAL 400/800 10kB (?) (*)
1 A NTSC/PAL 1200XL 16kB CO60616A, CO60617A
1 B NTSC/PAL 1200XL 16kB CO60616B, CO60617B (?) (*)
1 NTSC/PAL 600XL 16kB CO62024
2 NTSC/PAL XL/XE 16kB CO61598B
3 NTSC/PAL XE 16kB C300717
4 NTSC/PAL XEGS 16kB C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Breakout, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor.

Thanks to mailto:jlodoen@shell.portal.com (Jeff M Lodoen) for initial info.

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas.

The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Subject: 13.12) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==========
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, email-to: offen300@hio.tem.nhl.nl
==========
There are quite a lot! To get some structure in this section it's
divided into the following catagories;
a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]

Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]
- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]
- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]

Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 13.13) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List."

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

InfoMan (Trevor Holyoak), mailto:infoman@poboxes.com maintains a list called "Atari 8bit Support BBS's."

http://www.holyoak.com/atari/ATARIBBS.TXT

Subject: 14.3) Where is my nearest 8-bit Atari user group?

Rich Tietjens, mailto:atari@teleport.com maintains an Atari computer user group list at:

http://www.teleport.com/~atari/ugbbs.htm

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Unofficial Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

If you would like a text-only version you can send e-mail to:

mailto:kendrick@zippy.sonoma.edu

with the following as the subject:

send emulator faq

Note that the "better" version (which the text version is based on) is:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Unofficial Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

If you would like a text-only version you can send e-mail to:

mailto:kendrick@zippy.sonoma.edu

with the following as the subject:

send emulator faq

Note that the "better" version (which the text version is based on) is:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by David A. Paterson, mailto:davepat@total.net or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin, mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

In cleaning the basement (like many others) I have found an ATR 8000 attached to 2 5.25 floppy drives and the owner's manual that I cannot test. I'll take the best offer plus the cost of shipping from NY

1711. wanted ATARI for my french collection

I remember Galahad and the Holy Grail well. You had to locate the Grail
and return it to your starting screen. How many out there, like me,
completed this quest and can tell me what happens next?

A8 only .. libs 11 and 12 ... plus the St Transformer files from lib 5.
If I dig out an ancient CI$ listing from the old 8 bit forum, I should
have an idea if things were deleted .. I suspect yes, but perhaps someone
more active in the CI$ forums would know now.

>
>> I would really like to get a single file or three to simplify

Did, done .. single Pkzip file .. 24 megs or so. Pkzip bombed on my
system (choked perhaps) possibly due to my own system memory constrants,
but the file was there deleted, so I undeleted it and it looks valid
(passes the Pkzip -t).

>go to the next movie in the series.

Too bad there's no animation format for the Atari like there is for the Amiga.
(IFF.ANIM)
The PC's GIF format is just too slow,Flick (FLI & FLC) format is better.

Is there a chance that we'll ever see ATASCII BBS movies?

Since BASIC already stores files as compiled (but not assembled) code,I would
think that the TurboCompiler would actually produce assembled programmes.
Of course you need the run-time just as a C programme needs a run-time
library to run.
(at least in UNIX and the Amiga)
The use of run-time libraries is what makes the Atari,Amiga and Linux great.

Remember that BASIC just stores special codes instead of the actual text of
your BASIC programme.The PC's BASIC kind've does this but spaces take up room,
so many programmes are written WITHOUT SPACES.Also varrible names are stored as
text rather than as a index value.AtariBASIC stores them as a 1-byte
(high-bit set) value.So the trick of storing often used numbers as varribles
to save space has to be done with 1-character names.

huh?
Once a byte is received you have until another BYTE is received.

>Similarly if you send data out and don't wait for it to be shift out
>correctly before you send another word, it will get scrambled.

Normally you'd just have a interupt driven routine output data so you'd never
have to worry about that.The interupt will sound when there's room for another
byte.
(the POKEY input/output buffers are each 2 bytes,as compared to Apple floppy
controllers which actually has a 1-byte buffer)

>POKEY isn't as forgiving as the modern UARTs with FIFOs!

Well all serial-shifting chips have buffers.Wouldn't make much sense otherwise.
As I remember,the UART works pretty much like a POKEY chip.

This whole message sounds like you're talking about polled I/O.
Does this Gamelink cable work like the 850 interface or something?

>the 9 pin port. If not, you must use the composite video input
>coupled with the appropriate pin of the XL's monitor port. My
>guess is that the monitors DO support chroma-luma.

Why would you WANT seperate chroma/lumna signals?
Wouldn't that defeat artefacting for games like Ultima and Lode Runner???
The only use I can see is pluging the lumna signal into a monochrome composite
monitor in case you're calling up the Internet on one of those 80-col
programmes.(and no,simply turning the colour know down will NOT work)
I get a nice 80-col text display on my Apple using a monochrome composite
monitor.But the Apple only sends a lumna signal in text mode and supports
640x200 text mode.But it still gave a better display than a colour monitor.

It only works when the WHOLE screen scrolls.Otherwise it would have to clear a
bunch of bits in the display list so that only the lines below the cursor
smooth-scrolled.And it would simply be anoying when editing.

>- Does the E: device's built-in fine-scrolling apply only to GR.0?
>Or would/does it also fine-scroll in the 4-line "text window" at the
>bot-
>tom of the "graphical" GR. modes?

Yes,it does.It just sets the smooth-scroll bit for the last 4 lines of the
screen.Aparently non-scrolling lines have priority over scrolling lines.

Ah,"Newsgroup etiquette",the ultimate in nerd-dom.

It seems to me that he couldn't see his own messages.I hope he knows that readers like Tin read the whole list of messages at once.Rather than Waffle which doesn't buffer the message subjects/authors.So he may have to "re-fresh" the list of messages.

Datatypes?
Are you using a Amiga?

I can view this on the PC using DISPLAY,a programme from the Taiwan-Net.
You can FTP it from NCTUCCCA.edu.tw.
I don't know about Amiga "datatypes".I only had release 1.3.

In simpler terms,the 8088 is a 16-bit CPU made to work with ordinary memory.
(the 8086 needed special "16-bit" memory)
What I'd like to know is if the TI-99 really had 16-bit memory.
(even if it was only 256 bytes)

>In my opinion, the 4 M-hz Z-80 machines were about the equal (or
>slightly better ... depending on code) of the IBM-PC at 4.77 MHz.
>But when the IBM-PC came out, the Z-80 was at 6 MHz, and I vaugely

>The same thing happened in the Motorola camp, the 68000 was the 16
>bit upgrade from the 8 bit 6809, which had the 68008 16 bit
>internal/8 bit bus version, which underpreformed compared to the
>same generation 6809 (2 MHz version).

But even using 8-bit memory,wouldn't moving 2 bytes on a 8088 involve less work
since less op-codes have to be read in each time a memory-move loop executes.
(which is a lot for Apples and PCs in games)

Then again,simpler is faster in some cases.

>1/4 for my Atari. Any help would be appreciated.

Actually you want DOS 2.5.Everyone forgot all about DOS 3.
DOS 2.5 comes with a programme to copy DOS 3 files to DOS 2 disks.
It also comes with a DISKFIX programme to repair damaged files.
Actually everyone is using SpartaDOS and MyDOS.Someone should really write a
DOS FAQ.

Hmmm... you might be right, it's been so long since I've actually done it. But it is still not very forgiving. You couldn't use a BASIC routine to grab the data.

> This whole message sounds like you're talking about polled I/O.
> Does this Gamelink cable work like the 850 interface or something?

No, you'd be handling the I/O with interrupt routines which are activated by the arrival of input data, or the completion of output data.

Hello. I just checked out your page briefly. As soon as I saw it was in
England, I was out of there. I can't afford shipping from England. I live
in the USA. I imagine several people found the same experience as me.

Thank you,
Jason Whorton

You are starting from an incorrect premise here. BASIC does not do
any compiling. All it does is "tokenize" the program. BASIC is an
INTERPRETED language. This means that all converting to machine code
are done on the fly AS the program is executed.

1732. VINTAGE COMPUTER FESTIVAL

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-06 00:00:00 UTC
From: siconic@jasmine.psyber.com
Message-ID: <5usiadanr1@news.psyber.com>
Source record: 70352

```
Announcing the First Annual Vintage Computer Festival!
------------------------------------------------------

Mark your calendars! The first ever public celebration of vintage
computers will take place at the Alameda County Fairgrounds in Pleasanton,
California this October 25th and 26th.

The Vintage Computer Festival (VCF) is the first event of its kind
anywhere in the world. This two day festival will feature presentations
and workshops by notable computer industry figures and vintage computer
hobbyists. There will also be an on-site, hands-on vintage computer
exhibition. Experiment with the classic computers of yesteryear!

Each year a computer from the past is placed in the Vintage Computer
Spotlight. This year we focus on the Apple ][. To celebrate the 20th
anniversary of this classic, we will be giving away an original Apple ][
personal computer! Each person who attends the VCF is automatically
entered into the drawing!

Both seasoned and new computer collectors will enjoy workshops and
panels to share ideas and learn about finding, acquiring, restoring,
and enjoying vintage computers.

The VCF also features the Vintage Computer Flea Market. Find those old
computers, peripherals, manuals, and programs you've been looking for!
The flea market is the ideal way for new comers to the field to start
their own collection or for seasoned collectors to add to their existing
stash.

Celebrate the good old days of computing! Attend the First Annual Vintage
Computer Festival!!!

When: October 25-26th, 9:00AM - 5:00PM daily

Where: Alameda County Fairgrounds, Pleasanton, California

Admission: Pre-registered ($SAVE$)

Individual: $15
Family: $24 (two adults and four children)

Benefits of pre-registration include:

o Access to speakers, workshops, flea market and
exhibition
o Pre-paid parking

To pre-register, send a check or money order to:
```

Vintage Computer Festival
4275-29 Rosewood Drive #161
Pleasanton, California 94588

Please make checks payable to "Vintage Computer Festival"

At-the-door

o Speakers, Workshops, Flea Market and Exhibition

Individual: $10.00
Family: $16.00

o Flea Market and Exhibition only

Individual: $5.00
Family: $10.00

Please note: "At-the-door" rate is for a one day pass
only and does not include parking.

For more information including the latest list of speakers and workshops
please check out:

http://www.siconic.com/vcf

or send e-mail to:

mailto:vcf@siconic.com

SEE YOU AT THE VINTAGE COMPUTER FESTIVAL!!!

I apologize for the trouble. I had this e-mailed to me quite some time back, and it took me a LONG time to be able to view it! I can view it with Fractal Paint. If you still want the document, I can convert it into a JPEG for you. It is quite large, though. I finally went back and viewed it again. It is a design for an Atari 800, and is a little hard to read. Just e-mail me if you are still interested.

Do the boot menus use UltraSpeed or WarpSpeed?
You might turn off smart emulation (press "T"),that works when the programme is trying to use WarpSpeed.On the other hand,you may go into the configuration and turn off "Happy/Snchromesh".

If you need a Happy drive to run your boot disks then that might be the problem.Happy drives allow you to copy copy-protected software.But sometimes the copy will only work with a Happy drive.

>and to turn off : the keyboard sound?
>(1) Speed up cursor: POKE 730,1

Oh,I had to look that up in "Mapping the Atari" to understand what you were talking about.You poke in the number of jiffies (1/60th of a second for NTSC (USA and Japan),and 1/50th a second for PAL) in between each repeated character.The default of 6 (for NTSC,at least) means 10 characters per second.60 would be one per second,and 1 would be 60 per second.(doesn't work for 800)

>(2) Scrolling: Dunno offhand

POKE 622,255
GR.0

A second GR.0 will dis-able smooth scrolling.This WON'T work in Xformer. DUP does a GR.0 (that is,it re-opens the E: device).So to get smooth scrolling from the DOS menu,just POKE 622,255,then type DOS.
I don't think that SpartaDOS re-opens the screen,so you can just POKE 622,255:GR.0:DOS to get smooth scrolling there.
But SpartaDOS X won't work either way.I had to write a assembly programme that you have to run within the command processor.(doesn't work for 800)

>(3) Keyboard sound off: POKE 731,1 (,0 to turn back on)

Any non-zero number turns of key-click.(doesn't work for 800)

>(4) You didn't ask, but turn off disk I/O noise: POKE 65,0 (I
>think, 1=on)

Any non-zero number will work.RESET sets it to 3.(why?)

It sure is hard to type with a modern PC keyboard;no keyclick.I keep making mistakes.I miss my big old metal PC keyboard.

Do NOT use Xmodem.Use Y-modem.
X-modem is slow and buggy.Y-modem is fast and works.
Plus you can just tell BobTerm to send *.* files.
When it asks you whether to send each file or not,just type "A".
(for the file to send,type "D:*.*" or whatever drive you want)

>Organization: WebTV Subscriber
>Mime-Version: 1.0 (WebTV)

I've heard of those WebTVs.How you're supossed to view grpahics made for a
640x480 (and 80 columns) on a 160x200 (20 columns) screen is beyond
me.

>Have your mom or dad take you to the local goodwill, salvation army,
>or St.Vincent De Paul stores once a week. I found my 600XL in the
>box, power supply, all original documentation, and a big thick book
>on atari basic, at my local salvation army store for $8.

But you'll probably not want a 600XL,since it only has 16k of RAM.
So does the 400.The 800 has 48k of RAM.The rest are 64k.That's what you want.
(but not a ST,that has nothing to do with Atari Home Computer Systems (HCS))
So look for a 800XL,130XE,65XE or XE game system (really a computer system).
There's a 1064 cartridge that plugs in the back of the 600XL to bring it up to
64k.Also the really old 400s and 800s had 8k.
The newer one came with 16k.You could get cartridges (different from the 1064)
that actually went INSIDE the 800 to increase it's memory up to 48k.
But,like I said,you want 64k.
The 130XE actually had 128k of RAM,but the keyboard was horrible.If it isn't
broken when you buy it,it soon will be.And you really only NEED 64k.

>Or, go to A LOT of grage sales. Its best to get to them early.
>When I was 10, I knew of all the sales in the neighborhood.
>If both of these methods fail, keep reading the atari newsgroups.
>There is a lot of stuff for sale on: news:alt.games.video.classic
>and news:rec.games.video.classic

But if you're looking for something like the Sega Genesis or Super Nintendo,
then you'll probably be disapointed.
If you're used to the 8-bit NES Nintendo,then you might like the Atari.
While NES games look more colourful,they're kind of simple minded.
(the NES only has 2k!)
Also the Atari is a COMPUTER,not a GAME SYSTEM.Since many computer games are
just made by guys in their bed room rather than game systems,where all games
are made by money-crazed power-mad Borg-like vicous robiotic imhuman businesses,
you tend to get more variety in games.Computers also have keyboards so no
ultra-complex button combinations like in Super-Nintendo's Wing Commander.
And the games have more to them than senseless violence.
(not that I have anything against senseful violence;I just love blowing away
Daleks in Doctor Who DOOM)

I hate editors where you have to scroll to see the whole line.Better to have
40-columns.
(they might have a special character at the end of a logical line like text
editors do)

>doing high-level plus assembly. I'd personally rather just do
>assembly.

Yeh.On the PC,they look at you funny if you talk about programming in assembly.

>: Doesn't CMC music slow down the game? Isn't that sampled sound?
>CMC is 3 voices of sythesized (ie, plain POKEY) sound. (3 is
>correct.. you get the 4th for whatever sound fx you want, I
>suppose).

It sure sounds like it's sampled!
Of course it may be "dynamic" FM sound like De Re Atari talks about.
It may change the POKEY registers so quickly and constantly that it may be
useless for a game.

>It shouldn't slow it down... it runs during VB time...

I'm pretty sure that a VB routines steals cycles from a "foreground" programme.
But even if it took up the whole VB time,I doubt it would slow down too much.
(how much of a jiffy does VBLANK take up?)

>: Only the Atari would have something wonderful like 20 column text.
>Hey man! Quite useful! :) Speedier than drawing the same stuff in
>a graphics mode! :)

Yeh,the Nintendo NES does it all the time.
(that's why you see a bunch of text if the cartridge doesn't go in right)

>: Double graphics mode games will slow it down as well.
>: (if by med-rez you mean 160x200)
>Yeah... 160x200.. I'll use IRG text (ie, 4-colored, aka GRAPHICS
>12). I'll flip (during VBI) between two and flip two fonts. I've
>done it before. It doesn't look TOO bad. :) It'd be better if it
>were mixed with DLI, too, to interlace it and make it less flickery,
>but perhaps I'll add an option for black/white mode. :)

Remember tat IRG is a FIVE colour mode.Instead of inverse,you get a 5th colour when you add 128 to the ASCII or internal code.The 5th replaces the 4th. (memory location 710 controls the 4th,711 controls the 5th)

Thus,if you were making a RPG,you might set up black,white,green,blue and dark blue as the colours.If you wanted to have shallow and deep water,you'd only have to define one character for both.You'd just use the "high bit" to make the shallow water character into the deep one.

>: hard to find Sega joysticks.(I can't find them;no toy stores

>The Apple II line didn't even have a 320x200 mode though... max.
>resolutions in graphics modes are 280x192x8 for hi-res and the

It really was 320x200.The reason it didn't use the whole screen was because the high bit of each byte was used to cause the other 7 pixels (1 bit per pixel) to have their colour clock shifted forward by 50ns.This caused the artefacted colours to be different.This meant that for every 7 pixel,you could choose between green&purple and orange&blue.
Of course,anywhere on the screen,putting two pixels beside each other gave you white,and the background was black.
(couldn't change foreground and background colour like on the Atari)
This is 6 colours/shades,not 8.

>highly overrated double hi-res of 140x192x16, which isn't really 16
>colours, as the Apple IIc+ and back only had 8, but in double
>hi-res they just took hi-res and made every other pixel
>horizontally a white one. It's an optical illusion, really... I

You're thinking of something else.You can't have a single white pixel in hi-res.Double hi-res is 560x192 (I thought Apple was 190 lines,though).
This is the same as 640x200,but I don't know why the screen is narrow in this case,if only so they didn't have to re-invent the whole graphics system.
Since each pixel was a quarter colour clock,artefacting was created with groups of 4 pixels instead of 2.So by different combinations of 4 pixels,you got 16 colours.

>agree though, for tiled games. The other cheesey thing about the
>Apple II's games (aside from the pathetic 1-bit sound) were the
>fact that it did not support sprite graphics until the IIgs (the

I don't thin that ANY Apple supports sprites.

>newer video chip). Did you ever wonder why the animations were so
>chunky and slow? Because it had to redraw the entire screen as fast
>as it could to simulate motion. Don't laugh, I still own Apple IIs.

It would only have to re-draw the monsters/ships/pieces and the part of the background that they passed over,not the whole screen.

>As far as the C64's graphics go, it did have a 320x200 mode, but at
>only 1 bit per pixel (2 colours max.).

And each 8x8 square (the size of a text character) could have a different foreground and background colour.(out of 16 colours/shades)
Even better at Ultima-type games than the Apple.

>I love my Ataris, my Apples and the Commodore I used to have, but

Ah,I was just never that fanatical about the picture.I'm content with a
monitor.

>But there is hope! For $125 you can buy a TV to VGA adapter box,
>plug your Atari into the RF box and plug a VGA monitor into the
>other side.

Does that support artefacting?
(and not the kind where 320x200 becomes 160x200)
Artefacting is why the Apple's 280x190x2 mode gives you more than just
black&white.The Atari also have as 160x200 mode so it doesn't have to rely just
on artefacting like the Apple does.Still,games like Ultima and Lode Runner use
it (320x200) for a sharper picture.

The speed of the Atari CPU is half of the NTSC colour clock even if you're
using a PAL system.
The OS clock runs at the speed of your TV's vertical re-fresh.
(60 for NTSC,50 for PAL)

If you'd have looked at the catalogues, you would have realized that shipping to the US on about 99% of our products is just $5 per order. It can't be any better than that!

1752. 800XL for sale

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-07 00:00:00 UTC
From: smeg@umd.umich.edu
Message-ID: <5uuec1$bfd@null.umd.umich.edu>
Source record: 70279

For Sale:

Atari 800XL
Original box and manuals
All cables, and TV switchbox
FIle folder with old ads and stuff

This thing is like new. I bought it at a garage sale for the 1050 drive since I needed an extra and the guy was telling me how his father only used it twice. I tend to agree since the only fingerprints on the keys are mine when I fired it up and tested it. It's very clean and hardly used and looking for a good home (This makes me sound like a used car saleman ^_^).

price:

$30 plus shipping

Feel free to ask me for any more info.

Sam Lysinger
smeg@umd.umich.edu

Well the Atari basic was fixed in REV C.. (the XE internal basic and was
later released on another cartridge) But any serious BASIC programmer
would use BASIC XE, Turbo Basic Xl or CTH FAST BASIC.. (The latter works
VERY well with SpartaDos) Turbo basic Xl needed DOS 2.5.. (didnt work
perfectly under Sparta)

: The Commodore has MOBs instead of P/M (Player/Missile) graphics.

The big advantage of the Atari is its much larger color palette, 128 vs.
16 colors. Even though the Atari could use fewer colors per screen, it
made up for this in the display lists by allowing new color registers per
scanline.

From: Cliff Coleman <compufreaq@hotmail.com>
Message-ID: <873683115.2644@dejanews.com>
Source record: 70285

Wonder if the 8 bit experts could help me with this one. I'm getting alot of interference from my APE cable . I built it according to the specs and made sure every thing was grounded properly. I've got my 800xl connected to a B&W tv right next to my pc monitor, a NEC Multisync II. As soon as I turn on my pc, I can see a ghost image on the tv of the actual image on my monitor! If I unplug the APE cable, the interference goes away. ANY suggestions would be very helpful, as this is very irritating when I'm trying to play Hackers! Thankz in advanze :)

If this stuff gets crushed (and it will be a shame because the DataQue 816 board is a real historical artefact) then the only person to blame is Terry for pricing these beyond reason.

The mortal dklugh wrote:
: Actually the Apple's graphics,in regard to "tile" games like Ultima,is better
: than the Atari's.

The Atari is much better at action titles. And for playfield, it DOES
have that generous palette and the display list whereas the Apple and C=
have fixed palettes for that "cartoony" look. Atari playfield graphics,
as a result, often have a more painterly look from carefully chosen
palettes.

Actually thats not totally correct. The only ones that dont work are the
ones that puke in everything but a real USD/Happy drive. I've seen 2
loaders that did it, and they were both the 'hackers friend' type loaders
that were designed to archive boot disks.

I forget the names of them exactly but that was the case w/ the above disks.
If anyone has this problem in the future I have a EXE that will patch the
bootloader to smarten it up a little, and work w/ regular drives.

> service... :)

Here are a few good (imho) reasons to never go to any UPS shipper except
the customer counter:

1) Places like MB Etc charge far in excess of the real UPS rate. Packages
normally cost $6-$10 to ship can often end up costing $20+ each at places
like these.

2) They also mark up other UPS services, like insurance and COD.

3) They may apply garbage fees like a per package fee, etc that have nothing
to do w/ the actual shipping of the package and are just extra
profit.

4) They ship the package from thier address, not yours, so if its
refused or undeliverable it will go back to them, not you. Some
places will even try to charge you for this too.

5) If UPS breaks something, foget about getting paid for it anytime
soon. UPS will pay them, which will take a few weeks, and they
will take thier sweet time in paying you and may even ask for
a 'claims service' or 'pickup' fee. UPS makes no such charges.

6) If you send it COD the same problem above, they get paid, then you.

There are other reasons too, like they might lose you package in the back
for few days, non-UPS employees might steal or damage it, etc.

Save your money and go straight to UPS, if they deliver to your location
there is probably a service center within a few miles of your home or office.

If you dont know where the UPS customer counter is, call 1-800-PICK-UPS and
they will be happy to tell you.

1764. Help req xl-it atr files

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-07 00:00:00 UTC
From: caitken@netcomuk.co.uk
Message-ID: <34132952.15485127@nntp.netcom.net.uk>
Source record: 70291

I would be grateful if someone could help me with the following
problem.
I have the XL-IT emu and normally have no problem getting atr files to
run.
Recently I have downloaded a bunch of game files preppie 1+2 etc but
instead of one game on a single atr it appear that when unzipped there
must be 15+ grouped into a single atr.
When I click on the file instead ot the game auto running I get the
blue screen with the message boot error scrolling all the way down.
I would be grateful if someone could help me out .
Thanks

1766. Re: Ataris

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-07 00:00:00 UTC
From: thechyld@pcc-uky.campus.mci.net
Message-ID: <873669358_OASIS_@pcc-uky.campus.mci.net>
Source record: 70293

Actually, this is off-topic for this thread but I read your .SIG Steve, and I've got this APE/8-Bit user on my BBS who is having a few problems. He set everything up, but gets error messages whenever he tries to use APE. I think he said its something like "Disk Error 30 something" and something about the hardware needed to be checked? I know thats pretty vague, but is there any thing like most common mistakes/problems (fixes) that I can pass along to him that might help? Thanks in advance for any info...! :)

I'd like to buy the old EA game M.U.L.E. Please email me if you are
willing to sell. Thanks.

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 09/06/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 233 for various 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site,
including 12 for the Commodore Vic-20 computer!

I have the following printers available, for sale or trade. These
were acquired with various computer systems, and while they may work
with more than one type of computer system, I have included the
type of system that they were acquired with, where applicable.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

HARDWARE:

NOTE: The Lots listed below include only what is listed!

APPLE][COMPUTER:

LOT #1

APPLE IMAGEWRITER II PRINTER with power cord.

$54.00

*****

LOT #2

APPLE IMAGEWRITER PRINTER with power cord.

$29.00

*****

LOT #3

EPSON FX-80 DOT MATRIX PRINTER with built-in power cord.

$24.00

*****

LOT #4

PANASONIC KX-P1124 {24 pin multi-mode} PRINTER with built-in power
cord.

$19.00

****

ATARI 8-BIT COMPUTER:

LOT #1

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #2

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 9.00

*****

LOT #3

EPSON RX-80 PRINTER with built-in power cord.

$17.00

****

COMMODORE 64 COMPUTER:

Accessories:
$ 7.00 Star SG-10/15 Dot Matrix Printer Users Manual

LOT #1

RITEMAN LQ [model LTR-1] TERMINAL PRINTER (InfoRunner / Japan Electronics Ind., Inc.), with manual and built-in power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 7.00

*****

LOT #2

COMMODORE MPS801 MATRIX PRINTER, with built-in power cord.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$10.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 09/06/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 7.00 Home Filing Manager, The (Atari)
$ 7.00 Print Shop, The (Br0derbund) {3}
$ 7.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 7.00 Timewise (Atari) {1}
$ 7.00 Touchdown Football (Electronic Arts) {2}
$ 7.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$10.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 9.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$10.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$14.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$10.00

*****

LOT #2

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 8.00

*****

LOT #3

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print" Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for 400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

LOT #4

EPSON RX-80 PRINTER with built-in power cord.

$17.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

>The PC's GIF format is just too slow,Flick (FLI & FLC) format is better.
>
>Is there a chance that we'll ever see ATASCII BBS movies?
>

There's a possibility, but in gif format. It's the easiest to do. If I do any atascii movies, I'll give them to Tom D'Ambrosio, who runs the Break Movie Warehouse at http://www.flash.net/~ambrosia/index3.html .

BTW- It's now easier than ever to upload to the CTH FTP archive. I've got an activeX control that allows you to drag your files using windows explorer and drop them on the page. Boom, instant upload. No fuss, no muss, no messy ftp client. Check out- http://closertohome.dyn.ml.org/upload.html . Share your unique and most enjoyed software with others.

Absolutely no doubt about it - Joust on an Atari 8-bit is one of the
premier releases on any home machine ever. It't one of the few games
of the period that can hold it's own with players today.

I think the term you were looking for is "tokenized", not compiled. BASIC does not store files as compiled code.
"Compiled" usually refers to the translation of a symbolic language into a data format binary compatible with the processor (the "tokens" of the BASIC program have no direct equivalent to actual machine language, and as such have to be deciphered at run-time - therefore, the BASIC code has not been "compiled.") All that most non-compiling BASICs do is store a token for each command you input.
Some BASICs provide actual compilers to translate these tokens into actual machine language instructions, and it is the fact that run-time translation of these tokens does not have to be done that enables the speed increase (along with the ability to do more sophisticated optimization passes, etc. since you can take a little more time figuring out the best way to perform the required operations if you do not have to do it in real-time.)
"Assembling" refers specifically to the translation of processor-specific commands to machine language. The only difference between assembling and compiling, therefore, is that "assembling" involves a direct translation from a mnemonic (i.e. LDA, STA, etc. on the 6502, or mul, div, mov, inc, etc. on the x86) whereas 'C', 'C++', etc. (higher level languages) have no direct equivalent between the command being interpreted and the commands native to the processor (this is also why assembling takes way less time than compiling - 99% of it is just a simple look up to determine what actual machine language code should replace a text string - although this gets a little more opaque as you come to the latest microprocessors, since they often like to have their instructions streams "formatted" a certain way for optimal performance.) Note that "compiling" often involves an intermediate step of translation between the high-level language and assembler commands (most C and C++ compilers actually translate their commands to assembler commands, and then assemble that, but the translation to assembler is usually transparent to the user.)
Once a BASIC is compiled, there is no reason why it would REQUIRE a run-time library to operate (I'm sure some BASICs probably do need this, but that's simply because of the way they chose to implement the procedure.) A BASIC program can be compiled just like any other program and any dependencies it has can be statically bound to it (so that it wouldn't require any run-time libraries.)

- Loose

> (even if it was only 256 bytes)

If I recall correctly, it did not have 16-bit memory as built by TI, but the processor was capable of operating its bus as either 8 or 16 bits. Some TI hackers retrofitted their machines with 16-bit memory for the improved performance. Also I think the TI-99 did not run at the rated speed of the processor, so there were hacks to bring it up to that too.

> Europe.

Yes, but the floor wart for the 1200XL puts out 9V AC 60 hz. The
internal power supply might not be happy with 50hz. The best thing to
do is to rip out the internal power supply and replace it with an ST
power supply as Bob Woolley has described somewhere.

> >- The NTSC format
>
> Well, if you use the composite video o/p rather than the UHF output, things

> than I have....

The Nir Dary upgrade is for running PAL programs on NTSC machines. It
involves replacing the ANTIC with a PAL ANTIC, which changes the
vertical refresh rate to 50hz but does not change the color coding.
The only other thing involved is changing the OS ROM to look like a
PAL OS ROM to trick software that checks.

On the other hand, speaking from experience from when I lived in
Germany, an NTSC machine should work fine with a monochrome monitor or
black and white TV set. With a TV set you will need to bring the
sound out from the monitor jack to your stereo or something because
the spacing of the freqencies for the video and sound signals are
different--so you won't get sound.

You see a VGA signal on your composite monitor? Seems unlikely. Make sure
you dont have any wire to wire shorts, and your not topping out a marginal
power supply on the Atari side.

Message-ID: <3414636E.395D@senet.com.au>
Source record: 70297

Hello, I recently purchased a 1200xl with the intention of running
it on my 1802 color monitor, but the problem is that i can only
get it to display b/w pics.
Being in Australia we use PAL but i thought i could over come
the NTSC probs . Ive tried both composite video and the seperate
chroma,video lines like the 800xl,130xe.

Any suggestions guys ???

thanks

-> out there, I'd love to hear from you.

My comment is as a writer, editor, and 8-bitter, not as a lawyer:
A program does not become "public domain" just because the "code" is
published in a magazine and the magazine suggests the reader can
type it in on his own computer. The original magazine and all its
contents were presumably properly copyrighted, and labeling a program
as a "type-in" doesn't change its copyrighted status.

On their own keyboard and in the privacy of their own home,
anybody can retype any published material, whether copyrighted
or not. What they do with the copy they've made is another issue.
(Photocopying is easier, of course, but let's just talk about typing
since you seem to imply that the act of typing creates some kind of
originality and distribution rights for the typist.) There's a name
for such typing -- in countries like the late Soviet Union it was called
"samisdat." The problem is that circulating such copies, especially
selling them, runs up against copyright laws. By definition samisdat is
an underground activity; it flaunts the legal copyright regulations in
order to circulate its "pirated" copies. In a closed society samisdat may
be necessary, but that doesn't make it "legal." The original writer or
publisher who stated the copyright still controls the circulation rights
to the samisdat copy, altho for practical purposes they can't enforce
those rights because of samisdat being underground. The Internet isn't
underground -- it's out in the open. If copyrighted material is posted on
the Internet, the copyright holder may squawk about it. And depending on
how much money the copyright holder has to pay lawyers, they may be able
to do more than just squawking!

Michael,
If you have it, use Y-Modem Batch mode. You have to set one to send
and one to recieve. If you are sending files to the PC, the 8-bit neds
to be in send mode and the PC needs to be in file recieve mode. Unlike
Z-Modem, Y-Modem and X-Modem don't have auto-start-recieve. You must
manually start the recieve (download) once you start the send (upload).
Y-Modem also has the benefit of faster transfer due to larger (1K) block
size and 16-bit CRC error correction. If you must use X-Modem, select
X-Modem 1K CRC mode (if you have it). It's almost as good as Y-modem,
but is still missing some of the benefits, such as file size and auto
name transfer.
Hope this helps.

> power supply as Bob Woolley has described somewhere.
>

I have used NTSC equipment in Europe and PAL equipment in the USA,
and provided the voltage is correct I have never had any problems.
My 1200XL ran fine in the UK with a British 1050 power pack, and my
British Atari 800 runs great here in the States with the 1200's
power pack.

I also use a 110V/220V 750W step up transformer to drive my Sony
PAL video recorder and Toshiba TV, as well as Techincs Cassette
Player and Amplifier. My British TI-99/4A and VIC-20 also work here
without any problems.

It seems that most modern equipment doesn't care wether it gets 50Hz
or 60Hz, even if the label on the back says otherwise.

Graham

Dean,

Don't forget, you're probably looking at hit counts, rather than people counts. The actual number of people those hits represent would be a smaller figure.

There really isn't any way to count the number of people who view a particular web page. This is one of the main reasons why web advertising has been slow to get going, the people trying to sell "ad space" on web pages are unable to tell potential advertisers how many people might be viewing their ads.

(My order arrived just fine, BTW.)

Is the ATR a MegaImage? (ie is it bigger than 90k, 180k?) YOu may be a menu loader. look for MENU.ATR from Yogi's Jellystone Park? set it as drive one and set your file as drive #2. The reason your disk doesn't work is it may not have any DOS on it.

Since the two BBS's that I used to pull QWK feeds from are no longer in existance (FlightLine and WACO), I'm looking for another source that is 8bit Atari friendly.

I'll want to dial in with ICET, Zmodem down a PABQWK friendly packet and read/reply offline with Pabqwk.

Anybody doing this already? If so, what BBS and number are you calling?

If get gets error #130, device not found there there is probably a hardware issue to resolve. Check the cable wiring and comm port settings. If everything checked out OK he should have no problem boot from the APE disk.

With more info I might be able to offer more advice. He can always send me e-mail if he has an such access, or call me.

The difference between a XC11 and XC12 tapedrive ???

As far as I know the technical parts used inside are the same.

The outside is different, one looks a little like a small XF-551
diskdrive (with the XE-look) and has also that grey XE-color.
(Don't know the way of connecting to an Atari).

The other looks a little like the older 1010 tapedrive, is more 'flat', is
also grey and gets his power from the SIO-connector so no external
power-supply is needed. This one can also not be 'daisychained' cause it
hasn't got an I/O-port, just a cable with an Atari 13-pole-connector...

If you wanna see it, take a look at the PoolDisk CD-ROM, I almost know for
sure there are GIF's of them on that Atari-8-Bit CD-ROM...

Hey, i still have some programms in my download-sig's containing some
notes of SOFTWARE CELLAR...
Don't know which ones right now, but i know i have.

I still run a BBS on a true ATARI 8-Bitter. Uhhh, no, not using 8" drives
:-)

The BBS runs at an ATARI 130XE, 320Kb with a Black-Box, 14.400 modem and a
SCSI 676Mb harddisk.
It's officially online since 1 Januari 1997 and I'm running BBS Express!
Professional 5.0b. Runs great however I'm still missing some features like
Z-Modem download and a 19K2 connection-limit, but it's nice, and since a
few weeks even nicer since comp.sys.atari.8bit can be used at Thunderdome,
the ATARI 8-Bit BBS...

Sure are! I know of one on Long Island called The New Nest BBS, which is running PRO. There are a few problems with equipment right now, and service is a little sporadic, but it should be running properly soon. In the past, this board has netted with PRO boards all over the world, and that may be the case again, soon.

From what I understand, there is an FAQ on Atari BBSs.

SOMEBODY, PLEASE, help out with the location of that list!

Could someone please tell me where I could find a ROM image for Atarisoft Donkey Kong that ran on Atari 800? I had the game years ago but discarded my hardware when I moved to a PC. Now that emulators are available, and I've been hit with nostalgia pangs, I would like to play it again.

> solve the problem when all the math books say you need two!? :-) Obviously
> I have more reading to do.

The trig functions are usually computed by fitting them to a
polynomial, then doing a polynomial evaluation. To minimize the
number of coefficients, the angle is usually reduced to the principal
angle, then a range comparison is done to choose the polynomial.
Also, since sin is periodic and symmetric, and cos is just a shifted
version of sin, all of sin and cos end up being reduced to say sin of
a 0 to 90 degree angle for most of the computation.

ATN is harder and may need more tables of polynomial coefficients.

You can't boot off of the Hx: drives. They are there just like a D2:, D3:,
etc. You can display their directories and load files off of them. But you
have to boot off of D1:

<snip>

: Don't forget, you're probably looking at hit counts, rather than people
: counts. The actual number of people those hits represent would be a smaller
: figure.

: There really isn't any way to count the number of people who view a
: particular web page. This is one of the main reasons why web advertising
: has been slow to get going, the people trying to sell "ad space" on web
: pages are unable to tell potential advertisers how many people might be
: viewing their ads.

Actually, by determining from what IP address a request was made (ie,
the IP address of the machine running the browser the person was using
to access the page), you can get a general idea. Page hits are definitely
different from "hit" hits... One page with 10 graphics counts as
1 page hit, but 11 "hit" hits (if the graphics do get downloaded, as they
usually do).

So I guess the question to Dean is- how many PAGE hits did you get?
And when you said 295 people, are they actually PEOPLE? Or were those
just page hits?

Perhaps you had a very few REALLY interested people (ie, looked at many
different things, making for the high hits) of which a large percentage
(compared to that 0.67% (or whatever) you mentioned) did actually
order. :)

Bill Kendrick,

I've dragged out my old Action! cartridge and started coding from my AGDAGON source. I'll attempt to make you a simple demo program that links two Ataris together, sending one word back and forth, allowing each to control the other's background color by joystick. This is simpler than Agdagon:

it is two nodes, not up to eight

only one word is being sent, not four per update

a simpler "protocol" will be used to try to avoid lockup (when both would be listening for the other, and neither responds)

no error checking is needed

and probably some other things I can't think of yet. If I can't get Action to work, I'll switch back to assembler. BTW, is there any ordinary way to write interrupt service routines in Action? How do I force pushing registers on the stack? Popping them off? Performing an RTI? I imagine I can just imbed the machine language instructions, but that seems "brute force."

I am getting ready to move and I just ran across a big box of old Atari Stuff. I know it all works cause I use to run the Treasure Island BBS with it..Anyway so far I found:
1- Atari 800 (48K)
2- 800XL's
1- 1200XL
1- 810 Disk Drive w/The Chip
1- 800XL Power Supply
2- 1050 Disk Drives w/Doublers
6- Power Supply's
1- NEC Monitor w/Cable
1- Atari Basic Cart
1- Action Language Cart
1- Spectra Vision Joystick
1- 500 XJ Epyx Joystick
1- Supra Hard Drive Interface
3- Daisy Chain Cables

I may have more but this is what I have found so far...If anyone has interest in this stuff Send me E-mail as I don't get into the Newsgroups that much. Make an Offer....

<snip>
: However, out of these 295 visits, we have only received TWO orders. That's an
: order rate of a mere 0.67%. This is very surprising. According to our access
: log summary, 42 people have taken our ZIP file containing all the
: catalogues,
<snip>
: Surely out of all these people SOMEBODY wants SOMETHING??!!

Probably they do. :) If they're like me, though... they're more browsing.
I haven't seen your site, but, as an analogy, I did recently purchase the
BEST Electronics catalog. I've picked a few things out that I'd like
to buy, but I think paying for last month's rent and my school books is
a LITTLE more important than stuff for my Atari. :)

: One thing that really surprises me, is the fact that many people visit
: the site but then leave again without looking at any price lists, or
: downloading anything. I can't understand this at all?! How can folks
: decide we haven't got what they want when they haven't even seen what
: we have available?!

Perhaps they stumbled on the site accidentally, and are not Atari 8-bit
users... Perhaps they looked at the site when they saw the URL posted
here, but didn't have time or the inclination. Also, out of curiosity,
is the site fully Lynx compatible? :) Remember, Atari 8-bit users,
if they're USING their Atari 8-bit, are currently forced to use Lynx.
(Not like Lynx itself is bad, but the 99% of the web which is not Lynx
compatible because HTML authors are generally not very thorough ARE bad.
:))

: I can only assume people leave because the site looks a bit boring.
: The sole purpose of the site is to allow people to have easy access
: to our catalogues whenever they want them. If you want nice pretty
: pictures and such like, you'll be disappointed!

Nobody likes "boring" sites. :) But then again, as a web author myself,
I understand that getting more than the bare minimum up is not always
easy or quick to do.

One suggestion (again, I haven't seen the site, though) would be
screen shots! :) Those are always cool! :) But, then this takes SO much
time (unless you have an emulator capable of running the software you're
trying to shoot, in which case it doesn't take "SO" much time, but just
some time. :))

<snip>
: We sell PD and Commercial software for the Atari 8-bit, along with a
: variety of used hardware, software and magazines.

On a personal (or business?) note, how can I get some of my Free Ware
to you? Do you have any of it? (Hopefully only the good stuff... the
less good stuff wouldn't be worth purchasing even for just the price of
the disk, IMO. :)) Are you interested in a copy of Gem Drop when it's
done? :)

<snip>
: Our 80K catalogue lists all 190+ PD disks and details all our Commercial
: software.

Yoinks! How're 8-bitters gonna handle stuff like this? Easily, I hope?
(Just for compatibility's sake!)

<snip>
: The catalogues are available as individual text files, or as a combined .ZIP
: file for easier downloading.

Perhaps this answers my last question.. I'll have to check myself. :)

<snip>

Take care! THanks for still supporting the 8-bit! :)

interesting about Xl-it 0.20 help!,

Hello Richard,

>Alright, does anyone know how to get DOS to recognize more than 2 disk
>drives and actually see the "Hx" (harddrives)? No matter what I do, it
>doesn't seem to work. I am using Atari DOS 2.5. I have tried using

IIRC, both version 2.0 and version 2.5 of AtariDOS were supplied ready to
deal with 2 drives. Somewhere in the DOS manual or a memory map, will be
listed the location in RAM to poke to alter the number of drives supported.
Once the value has been altered, you need to return to DOS and write DOS
files to disk to save the value.

Sadly, all my manuals are elsewhere, ATM, so I can't refer to them.

Presumption isn't going to hold in a legal dispute. A collection of any sort maybe copyrighted even if some or all of the components are public domain. Take a look at the copyright notice in a Dover book.

> underground -- it's out in the open. If copyrighted material is posted

> to do more than just squawking!

Yes, but why? To what end? That's money down a rat hole when the subject is 8-bit Atari software. If anything, it would be nice if the publishers would release the old titles as shareware at about $1 per title. I'd, personally, be very happy with that arrangement.

Remember when there wer lots of Star Trek sites and then Paramount made the owners take them down? What good did they do? They certainly didn't increase their coffers, probably just annoyed a lot of die hard fans.

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.
PKZIP should just get a error from MS-DOS and exit.And PKZIP (2.04g) uses XMS
memory.(and EMS,but nobody uses that anymore)

How much MS-DOS and XMS memory do you have?

>bank select the drives, that way I could use up to 8 drives...

Well it's the ATR8000 that's limited to 4 drives.MYDOS gives you 9 drives.
It's only limited by the DOS.

>Oh yes, the drives were used with CPM or the standard atari DOS..

Did anyone really use CP/M?
You're better off using the normal AtariOS.Basicly all you can do is read/write
single bytes from devices.(numbered,not lettered)
Because of this,DOS has to be hacked into CP/M.It only allows you to read/write
in 128-byte "records" to disk files.No support for sector-access.
(there's probably a standard BIOS routine to do sector-access)
Anyway,to move the cursor,change colours and so forth,you have to send special
terminal-control codes.Like a BBS.(even if you're not using a terminal)
Forget about burst I/O and screen accelerators.
Oh,and a directory entry can only keep track of 16k of a file.So a 32k file
would take up 2 directory entries.The 2 entries would both have the same data
except for "extent#" and the sector-maps,of course.
(rather than using the whole second entry for the sector-map;like Win95)
You can imagine the problems.If you had 47 little 1 record files
(CP/M files are always a multiple of 128-bytes long,hence X-modem)
you couldn't have 1 BIG 48th file.It could only be 16k.
(assuming 48 dir-entries.Some CP/Ms used 64)

As you can see,I really don't like CP/M.No XIOs!

Source record: 70149

I think there is a simple reason why noone is buying. The Atari 8-bit platform can not support commercial software anymore (except maybe emulator products). That's why. People still tinker with the 8-bit and play with emulators, but they won't spend a penny on them if they can avoid it.

I hate being Mr. Doom and Gloom, but it's true.

Where is FTE? Is CSS or K-Products anything more than two guys who occasionally repair or upgrade 8-bit systems?

There is nothing left but pirate sites, PD online archives, and Bill Kendrick is the only truly active programmer I know of.

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.

And if the requested amount of memory is not available then the OS will say so.
And of course every programmer always
- checks the result of every system call
- writes appropriate code to deal with the case that the system call failed
- actually tests all of these special cases to see that nothing bad happens.

And I have a claim on some Martian real estate that you really should buy.

Dear all,

I've been trying to extract files from Atari ATR disk images to my PC
without much success... S2PC reports file size is wrong.

The size is 133136 K, downloaded from ftp.sodre.net, directory
/pub/users/cmwagner/atari8/mirrors/ftp.hackerz.com/bootdisk****.

The files work fine in the emulators. Any help?

Are you specifying an .atr image as D1: and/or D2:? The demo version of
rainbow does not support loading in individual com files that reside on the
hard drive. All files must be contained in a disk image file.

>Anyone experience these problems when they first started using it?

> I have more reading to do.

Actually, sin, cos, and tan are given as a ratio of two sides of a
triangle. And no matter what the size of the triangle is, the ratios
will always be the same for any given angle. From another point of
view, you could also say that you already know two things about the
triangle: one of the base angles is always 90 degrees.

Often a copyright owner will sue even though he doesn't want
to. Why? Because if he fails to enforce his rights, his work
will become part of the "public domain".

Michael,
If you have it, use Y-Modem Batch mode. You have to set one to send
and one to recieve. If you are sending files to the PC, the 8-bit neds
to be in send mode and the PC needs to be in file recieve mode. Unlike
Z-Modem, Y-Modem and X-Modem don't have auto-start-recieve. You must
manually start the recieve (download) once you start the send (upload).
Y-Modem also has the benefit of faster transfer due to larger (1K) block
size and 16-bit CRC error correction. If you must use X-Modem, select
X-Modem 1K CRC mode (if you have it). It's almost as good as Y-modem,
but is still missing some of the benefits, such as file size and auto
name transfer.
Hope this helps.

What I sought to convey, without resorting to spelling the particular
expletive I had in mind, was that rather than correct the errors which
resulted in multiple postings twice I would have preferred not to have
let them loose in the first place.

I would rather have terminated their existance shortly after creating them.

There: is that a full enough explanation?

Blimey, you try to be brief....

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-10 00:00:00 UTC
From: rosborn@geocities.com
Message-ID: <341ecf51.3741647@news.mindspring.com>
Source record: 70167

For sale:

ATR8000 $45 + shipping

Allows PC compatible DS/DD (or lower) drives to be placed on the
Atari 8-bit SIO line. Also provides a serial and parallel interface.
Will serve as a CP/M machine with proper software (which I do not
have).
I'll include a 720K DS/DD drive,cable, and boot disk for an extra
$10.

This unit is kind of heavy, so I'll ship it USPS 4'th class to cut
the shipping cost.

1848. DGS Web page stats. -- some questions answered!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-10 00:00:00 UTC
From: DGS <dgs@clara.net>
Message-ID: <5v77op$5kk$1@eros.clara.net>
Source record: 70172

Thanks for the comments regarding our posting about our Web page statistics.

I would just like to clear up the question of "hits". When I said 295, that was 295 actual people. Every day at 4 a.m. my ISP delivers a full access log for the last 24 hours into my ftp site. That log contains a list of every file taken/looked at and every domain name of the site which took it.

I can go through this finding individual people by just blocking a list of the same person getting different things, so at the end I can get a number of different people who accessed the site. The total is now well over 300 BTW.

I find it hard to believe that people just stray to the site by accident. At the moment it's on no search engines, it is only advertised in the atari.8bit news group. It's also well advertised as being an 8-bit site.

I should also point out that DGS is now a hobby business. It's been many years since it was my main source of income. As long as it doens't take up too much time and money, I will continue supporting the Atari. I've been doing this since 1988 and at the moment there's no reason to quit.

It was surprsing to hear that one person at least didn't download the catalogues because he realised we are UK based and thought that delivery would cost a fortune. It doesn't!! On virtually all orders, delivery to the US is just $5. It will cost you no more than $1 (usually less) to send your order to us by mail. We accept payments in US$ in cash, so this costs you nothing extra either. The whole ordering process is quick and easy, and you can usually expect your order to arrive about 5-7 days after we have sent it out, which is the same day on 99% of orders. You won't have to pay any import duty because we have ways around that!

So, there we are! If you want to look at the site and get the catalogues, the address is:

http://www.dgs.clara.net OR http://home.clara.net/dgs

E-Mail: dgs@clara.net

Dean Garraghty.

1849. Atari 130XE BUG? Definately a problem!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-10 00:00:00 UTC
From: BobKlaas <bobkla19@tcd.net>
Message-ID: <34173A7E.C374A7C@tcd.net>
Source record: 70173

Having repair many of these fine machines I am supprised that I have not encountered this
problem, prior to my last repair shipment. While doing the normal testing of any computer my
area is clear, clean ect..Nothing comes in contact with anything else and I do not move bump ect any item..(My Mistake) Pristine areas as I now find out do not tell the truth.

Reading the senders notes with the equipment sent...whole system, with MIO ect..which
means they have a Cart Port extender..(produced by ICD, doesn't matter who) when this item is plugged into the computer the cartridge is up in the air available to be bumped
ect..when bumped the computer port contacts disengage and create a problem with memory.
and the computer itself. Yea I know the port has a loose contact or a trace is cracked.

This is not so!...I went through 6 other 130XE's same setup and same problem happened computer lost track of what was going on and had to be reset...So, pulled the Expansion Port
and put in a Cartridge, now the cart in the 130xe is protected back behind where nothing touches it, so repeated the same test...guess what? On all 7 Atari 130XE's if you bump the cartridge the computer flakes out...Thought ok so hot glued the port to the board to eliminate movement, well it eliminated a minor bump but not one with a little more than normal..

This cartridge port design actually sucks, unless you use it as it was intended by Atari PROTECTED!!...

Anyone else have one that works flawlessly?

has anybody used lisp for atari?

b&c has something called interlisp/65, but it is under communications
software.....

is this the lisp language/environment??

I know thats relatively slow by todays standards, but its not the fact that
they are a BBS operating at 2400 baud, so much as that they are an Atari
8-Bit BBS operating at all, don't you think? :)

I have an Atari 400 computer with 32K RAM and a 1050 disk drive (w/o power supply...) and I was wondering what the best OS would be for my computer. I've heard about lots of different ones, but which one is everyone's favorite (that would run on my computer)? Thanks for your help!

-Sam

P.S. If you have an Atari 1050 disk drive Power Supply (same as Atari 400 PS) for sale for a good price, let me know, because I need one. Thanks!

People may laugh at me for this, but here goes. Atari Logo comes close. I was surprised at the depth of list processing one can do with Atari Logo. If you take away the turtle graphics, the rest of the language is pretty much a subset of lisp. Or am I being crazy again...

Source record: 70235

I think you're asking this because all you're getting is the "memo pad" at startup. The OS is already built into 10K of ROM inside the 400. Maybe what you really want to know is what DOS to load from a disk drive or maybe what language cartridge or disk to use to program the machine. I'm sure you'll get lots of opinions on these two issues.
Atari DOS 2.5 is a good safe DOS to start with. If you ever advance to higher capacity drives, Spartados, Top Dos, Mydos, and maybe a few others can address disk partitions as large as 16 megebytes.
Atari Basic is probably what one might call the "standard" language for the Atari 8 bits. It's actually built into the roms inside the 600/800XL and all the XEs. To get a language on a 32K 400, you might have to get a cartridge. Does anyone out there know if any disk based languages work in 32K?
I started out using Atari Basic. Microsoft Basic II actually matches up pretty well with a 32K Atari, because it uses a 16K rom that won't overlay any of your ram. For programming joy however, I love the old OSS languages. Basic XL supports player-missle graphics, Action uses structured top-down programming and compiles to very fast programs, and there's MAC 65, a terrific macroassembler for taking advantage of anything the Atari can do.
That's my 2 cents.

I agree. I used logo to explore the possibility of using it for creating
adventure games. It's ability to process lists of words made it a pleasure
to use. Since then, I've used the inform ver. 5.5 compiler to create games
for the virtual z machine (level 3 infocom). I've got 5 or 6 of these new
atari 8bit text adventure games at
ftp://closertohome.dyn.ml.org/ftp/pub/Atari_8bit/New/Games/TGAMES.ARC .
Well, they may be over a year old now.

Hi Bob!

I don't own an Atari 130XE, but on my Atari 800XL with is upgraded with
a RAMbo-style upgrade has a similar problem. When I have a cartridge
loaded in, if I wiggle or even TOUCH the rom while the computer is on the
machine dies (screen turns green) I opened up the 800XL and fiddled with
the cartridge slot, ended up removing the plastic part near the cartridge
port. It fixed the problem for awhile but it still happens.

They don't make Ataris like the 400/800 anymore! Those were
indestructable tanks.

Alan

funny you should ask. a couple years back i remember hearing the
latest 'industry' buzz-word, and thought to myself...marketing
departments had finally floated way past good sense.

that term was 'out of the box experience.'

still, the term, at least for me, seems appropriate when applied
to 8bits.

they are fun, easy to understand, program, and hack.
they offer sound, graphics, and have much the same appeal one
usually attributes to macs and their users.

however, i think that one of the biggest reasons i presently haunt this
group is the people... i have never had a question go unanswered,
sometimes by writers i read as a kid...and those in a very unassuming
way. people here are honest (read the moral opinions regarding
copyrights), friendly, and truly talented.

this is the best of both worlds, there is no microsoft beast (unless
you consider jts a rising power), but there doesn't need to be.

finally as it was once said "it is not to arrive, but to journey."
be amazed at 1.72(?) mhz..

my 2 cents.

Some thoughts:

1. Lots of folks have warm, fuzzy, nostalgic feelings about the glory days of the Atari computer era.

2. People like being technology archeologists, collecting old software and hardware.

3. In many ways, modern computers have gotten to be very complex and stress causing. It's very relaxing to use a computer that you can understand completely.

4. There's comfort in something that doesn't change. Heck, the discussions here are roughly the same as they were seven or eight years ago

5. It's extremely interesting that 18 year old technology can still do some pretty impressive things. Games like Dropzone and Rainbow Walker can still impress, even in 1997.

Well, its kinda hard to put into words. For me, its the fact that an Atari
800XL was my very first computer. That alone warrants a special place in my
heart. More than that though, is the "mystique" of a computer system that
could do things so well, for its time...incredible reliability, the list
goes on and on... :)

For me it's the "good old days" thing. The very first "home" computer I ever owned was an Atari 800. I didn't realize it at the time but it was the most important purchase of my life. I recall staying up late (risking sure scolding from my mom) hacking out code and playing games. Today I am a programmer and work at Microsoft. When I recently acquired an old 800 (saved it from the trash, actually) it brought back not only memories but the fun of those times.

Interesting...

I was curious to see if this guy was legit, so I tracked him down as far as I could, only to discover the address he previously posted (under a different company name, no less) was non-existent. Anybody looking to blow $5, go right ahead, but my gut feeling is this guy is a postal worker, trying to scam you into sending money that he can intercept before it gets hit with an RTS.

Of course, the worst part is that no one would admit to sending the money, because what he's offering is illegal anyway. Pretty good scam, as long as you don't get caught.

Be warned.

1880. Last Chance Sale -- DC Area

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-12 00:00:00 UTC
From: bowtie@netcom.com
Message-ID: <bowtieEGDI2t.9F8@netcom.com>
Source record: 70254

Posted for an associate with a failed network connection ...

The time comes for all good things to end and that time has come for all
of my Atari 8bit hardware and software. From 1981 to mid 1983 my wife and
I both worked for Atari and in early 1982 I designed and managed the
development of the AtariWriter cartridge word processor. After I left Atari,
I designed and sold via mail order all of the Printer drivers for the
AtariWriter cartridge. I sold my last Printer Driver only a few months ago.

But the time has come to move on and I'm having a Yard Sale at my residence
in Vienna Virginia on Saturday, September 13th from 9am to 3pm. I live
just off Route 123 half way between Vienna and Oakton off exit 60 on I-66.
Just follow the signs to the YARD SALE. At the end of the day, anything not
sold or given away will go to the Salvation Army or Goodwill.

Everything goes ..... even the original copies of the drafts of designs
for the 1200XL, several versions of the Atari Operating Systems specifications,
and numerous copies of De Re Atari, and other user manuals. Because my wife
and I both worked at Atari, we emassed multiple copies of most hardware and
software, some of which is still brand new and never used. Everything I have
for sell has all cables and power supplies and is great working condition.
Stuff for sale will include, but definitely not limited to:

(2) - Atari 800 computers
(2) - Atari 810 disk drives
(1) - Atari 1050 disk drive
(1) - Atari 850 interface
(1) - Okidata 92 Microline printer
(1) - Atari 825 printer
(1) - Atari 1027 printer
(1) - Atari 1200XL computer (brand new)
(1) - Atari 600XL computer (brand new)
(1) - 12" monitor
Lots of application software and games free with hardware purchases

In case you cannot make the Yard Sale, but still want to entertain the
purchase of some of this equipment, you can email me at:
garyfurr@juno.com

Thanks,
Gary Furr

Because the Atari systems has soul! I was totally hooked when I first saw
Star Raiders on the Atari 800. I did at that time have a couple of
Commodore 64's and a 48K Spectrum. But, they didn't touch my heart at all!
I now have a P150, but it still doesn't give me anything else than a couple
of good games (War Craft II, Warlords III, Red Alert and Dungeon Keeper)
and access to the Internet! I love my Atari and especially after I got a
MIO 1Mb with a 40Mb HD. Take Atarian care and if Bill Kendrick (Hi! ;-))
and I can co-operate on some games, maybe you'll see some new games for the
good old system soon! Greetz from Hawk of Pokey Soft!

Bull Shit. I spent too much time making a list of what I had on this
list and here's the answer I got:

hi,

perhaps i'm interested in your ATARI 810, is it a tandon or a mpi
version?

thanks

1883. New Lower Prices! Atari!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-12 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5vb112$30i$1@kelly.teleport.com>
Source record: 70257
Cross-posted to: or.forsale,pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a
Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM
Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4.
(2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a
Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari
Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar
Systems. If you have what I'm looking for, check my Atari Catalogs or
E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an
order of enough of my stock. One example, a customer ordered over $200
of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Gary,
Sorry, I don't have that image, but it sounds interesting. Anyway, there
is a program for the 130XE (only) called degasview. Locat that and you should
be able to view the image when you get it. I have a copy someplace. If I find
it I'll e-mail a copy to you. In the mean time, check some of the FTP sites
for it (the viewer).
If you happen to get a copy of that picture, could you e-mail a copy to
me?

Michael,
JACS (The Jersey Atari Computer Society) is still alive at (609)
346-1224) It's actually an ST run Citadel format BBS, but has loads of
8-bit support. It's 24 hour 1200-14400bps. The Sysop os Mike Hoppkins
(mhop@snip.net). The BBS has been in constant service since 1982.

Cliff,
Seems like your two computers are too close together. I have a somewhat
similar problem. The two monitors interfere with eachother. They are less
than 12" apart. The magneticism generated by the monitors is at a slightly
different sync time and the displays quiver a bit. No image transfer though.
You APE/BIO2PC cable may be acting like an antenna and picking up the EMI
from you PC's monitor. Try moving the APE cable away from the VGA monotor
and/or finding a way to shield the cable better.

Bob,
I can't say flawlessly, but I have a similar setup. 130XE, MI/O
w/extender SpartaDOS X cart wirh BASIC XE cart stacked and R-Time8 in cart
slot 2. For the most part it works pretty well. All of the is open to almost
any kind of bump. All this sits on an old TV cart next to my PC. Since it
sticks out into the room, it tends to be vulnerable to this type of
situation. I've had lock-ups on occasion, but never thought that it could
have been a cart bump. I'll try it out and report back tomorrow.

David, I used to ask myself the same question. The answer has so many components, and so many of us differ about the relative importance of those components, that I could keep my user group's newsletter going for the next thirty years with that discussion.

Relax, enjoy the popularity. If you hold on to your Atari stuff, all the better. If you absolutely must dispose of it, consider staying in touch with the feeling through emulation. That's not quite as good, but getting better!

Hi,

Yes I've used APE, it works quite nicely. Its really a nice feeling to see your trusty Atari 8-bit controlling an IBM. Actually I took my APE system one step further, I bought an Atari PC-5 386SX computer from B&C Atari Sales & Service and connected my Atari to it, so I have an Atari 8-bit using an Atari PC as the server, sort of fitting isn't it.

B&C Atari Sales still has a large quantity of Atari PC-1 computers with Digital Research GEM windowing operating system, they also have Atari PC monitors as well. They may still have a few Atari PC-5's lying around as well, give them a call at 408-986-9960 or check out their web page: www.myatari.com

Everyone will have his own reasons, but I like the Atari
games. They are great. Bt for any "work" I do chose
a more modern computer.

At the time, before the IBM PC, Atari (800) was the best computer on the market -- far better than the Apple. I used them as 'business machines', as substitutes for the IBM magnetic memory typewriters.

But Atari had a "game" image, in contrast to the Apple "school" image.

But it was arrogant management (Ray Kasar [sp]) which killed off Atari (a $4 billion [yes] at the time).

Also note that the Macintosh program GraphicConverter can read a file in
just about any graphic format, including Degas files. Look for it in the
info-mac archive.

Now back to your regularly scheduled Atari stuff.

The Atari's, like the Commodore 64's and the Apple II's were computers built for programmers. I remember thinking when the atari came out that their version of basic, the handleing of the sprites, ect, were a little strange. But these differences were what made loyal followings of programmers. In certain circles, actually BUYING software was considered sacralidge. I remember being able to get TONS of software, locally, for the price of a blank diskette. Kind of like the car you choose, you knew something about the person when they told you what kind of computer thay had. And to me at least, there seemed to be more of a sense of excitement, of doing and being in on something wonderful.

I also think that the original home machines will always be remembered. These early home computers were our introduction to this new version of mans best freind. And PC manufacturers are just now remembering that ease of set-up and ease-of-use are paramount to wide-spread acceptance and market penetration.

All exastentialism aside though, the things still work. And work well.

Does anyone have a DOS to boot-disk converter or
any one of the numerous menu programs (Ian.K/Rob.C/etc.)
which abounded for the Atari?

I actually wrote a wee utility to convert various file/
menu types to other formats, but that died along with
my 1050 some time ago. I did distribute it though...
Damned if I know what it was called however!

>(w/o power supply...) and I was wondering what the best OS would be
>for my computer. I've heard about lots of different ones, but which
>one is everyone's favorite (that would run on my computer)? Thanks
>for your help!

Well only a 64k Atari can use RAM OSes.
There is a RAM OS that speed up the floating point.That probably just copies the OS ROM to RAM and replaces/patches the FP part,like a high-speed SIO handler does.They are used with high-speed disk drives to switch the buad rate to whatever the disk drive protocol uses.
(UltraSpeed drives can have different speeds,the patched OS asks it)
The Floating point is used by BASIC so BASIC games would go faster.
I've never really heard of a RAM OS replacement,just patches.

UltraSpeed OS is a ROM based OS.It's put out by Bob Puff.
It also supports RAM disks.(so boot games will work with them)
I don't know if OS ROM chips for the XL/XE would work for the 400.
Anyone have a idea?

I would chalk it up to two issues.

First, most of the people posting here have "cut their teeth" on Ataris, myself included, and many of them (again, myself included) have kept their 8-bits running through several computer upgrades. (My own went from 400 to 800XL to ST to several Macintoshes, and all but the ST still works.)

Which is the second reason: The 8-bit Ataris are notorious workhorses. There are probably more *working* and *usable* 8-bit Ataris than any other 8-bit machine (with the possible exception of the Apple II series, only because Apple still supported them for years after 8-bits "died").

I've worked out a microcontroller interface for a PC AT keyboard to my 800xl,
but the only way to make what I would consider a nice clean pcb is to
get another one of the .100 flat cables and sockets that are used in
the XL/XE series.

I would like to put a socket on the board, so the cable from the real keyboard
goes into that, and the new cable goes into the XL motherboard so both
the AT keyboard and Atari keyboard both work.

I see AMP makes a .100 ribbon cable with pins on the ends, which I think is
similar to what was used in some of the 600XL units, and would work, but
the problem is there is not SOCKET available (at least from DigiKey) that
will accomodate the original ribbon :(

Thanks for any help.

Steve

1905. Emu authors: Please support snapshots!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-13 00:00:00 UTC
From: h0142kdd@joker.rz.hu-berlin.de
Message-ID: <5vdgcu$924@joker.rz.hu-berlin.de>
Source record: 70180

It seems that none of the Atari emulators (I've tried XL-it, Xformer, Pokey, Atari800) supports memory snapshots, e.g. saving a complete memory dump (plus all the necessary registers) to a file. Since this is obviously a useful feature (for example if you want to resume a game later), and since it's trivial to implement, I really wonder what prevented the emulator authors from supporting it.

1907. Re: Why is Atari still popular.

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-13 00:00:00 UTC
From: "Tom Hunt Sr." <tomhunt@bright.net>
Message-ID: <5vdvfl$es@cletus.bright.net>
Source record: 70182

>
>I never would have thought that the 8-bit fan culture was still so
>active! Can anyone explain this?
>

There are people that collect and use antique radios, classic cars, etc. I think some of us atari 8-bit enthusiasts have some things in common with them. Some of us regret having sold our first automobile, because of the fond memories associated with it. We've learned it's sometimes better not to sell our "first love", but to keep it, maintain it, and take it for a spin every once in a while. Others use the A8 every single day to do the things the need to do. Dial-up bbses and text processing comes to mind. Some are creating eye-popping demos.

Whatever the reasons that individuals may have for their continued interest in these machines, the camaraderie among this group is the best there is. That is reason enough to keep bringing me back.

> (with the possible exception of the Apple II series, only
> because Apple still supported them for years after 8-bits
> "died").

That's certainly the case for me, too. The Atari 800 was my very first computer, and I started off with that and the 410 program recorder. Those were fun days. Most everything I ever had to know about computers, I learned it right there. We didn't have it easy; we had to do literally everything "manually," if you know what I mean. None of these computer newbies today would survive one day if the 8-bits were still in existence. <g>

As for the workhorse thing, that's one of the best things about Atari. I think you'd need to smash them with a sledgehammer before they finally busted. My 800 went through some heavy usage, surviving some mishaps here and there, but still worked fine. And it still does today, after over 14 years. My 130XE also still works like a gem after 10 years, but hasn't gone through the same heavy duty use.

Oh, it's even better than that: this solution flat out doesn't
work for anything but notch filter-based scrambling which paradoxically
is still in use for Cinemax in LA but I haven't seen anywhere else
in years.

And what's still better than that is that said plans are available
for free simply by searching Deja News for one of the many
times they have been posted.

Still, I'm all for anything that parts an idiot from their money...

1916. Looking for old cassette game: "Mar Tesoro"

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-13 00:00:00 UTC
From: aramos@coil.com
Message-ID: <aramos-1309971929550001@cmhbd.coil.com>
Source record: 70191

A co-worker of mine had a friend who made this game. He says it was released commercially but he doesn't remember the name of the company. As far as he knows, it was released only on cassette. It was probably a boot loader (i.e. not written in BASIC).

If anyone has heard of this game or knows where to get it as a load file, please let me know... he wants to use my copy of Rainbow to re-live some of the past!

Thanks,
Tony R.

Yep, wherever you get those BEEP BEEP BEEP BEEP BEEP BEEP etc
scrambled signals rather than the wavy picture or the complete
removal of the signal. Century Cablevision in LA uses all
three systems for various channels for some reason.

I have the following atari 8-bit software for sale.
I want to sell it as a whole, for $23 this includes shipping
I can't garantee they work because I have since sold my 1050 floppy
drive. But the last time I used them they worked and I have never had
any problems with disks and my atari. I have XE game system, they all
ran on that. So if you need to know if certain software requirements
I can check. I should have most or all the manuals.

excalibur
Star Rader II - atari
summer games -epyx
silent service
wizards crown - SSI
Exodus Ultima 3
Music Construction Set
F-15 Strike Eagle
Bop and Wrestle - 64K required 128K recomended
Scenery Disk for Flight Sim 2, the san fran and bay area
La Swat and Panther
Galahad & the holy grail
Mind Shadow - Activison
Shattered Alliance - SSI

I also have a 2600 and a few games I want to get rid of. I have no
joysticks or TV adaptor. I only want to sell it for the cost of
shipping. $8 or to trade for 7800 stuff. If you have 7800 stuff you
want to sell please email me too. I want 7800 games and controllers.

It is the same one as a 1050 disk drive, in fact I use 1050
power supplies on both of my MIO's.

Actually, (and I will gladly accept correction as I am not an lawyer) the copyright is valid whether or not it is defended. With the Berne Convention now in place I never quite remember the duration, but I believe it is still something like life + 50 years. After that time, the work becomes public domain, period. During that time the author can explicitly place the work into the public domain, at which time all rights under the copyright are lost, including the right to somehow limit the use of the work while it is in the public domain.

On the otherhand, a Trademark, once issued, is perpetual until such time as it no longer is actively maintained by the owner. This is the thing that if you don't sue or otherwise stop entities using it improperly you lose the trademark. In this instance you get the situation as recently disclosed that Microsoft was going after people improperly using the trademarked name "Windows NT" in product names and other materials. For the obvious reason trademark owners do not want their trademarks diluted, etc., but by the other hand if it is ever shone that Microsoft did not defend the name Windows NT from improper use they would lose all control over the name. However, they would always retain copyright to the actual software product per the terms of copyright law.

THANK YOU! THANK YOU! THANK YOU!!!!

<specs snipped>

Sounds like just what I wanted! :)

: and probably some other things I can't think of yet. If I can't get
: Action to work, I'll switch back to assembler. BTW, is there any
: ordinary way to write interrupt service routines in Action? How do I
: force pushing registers on the stack? Popping them off? Performing an
: RTI? I imagine I can just imbed the machine language instructions, but
: that seems "brute force."

Brute force is fine with me! Heck, that's how C programs get streamlined!
:)

And BTW, the VBI code I have does a "DEFINE RTI=(whatever # RTI is in ML)"
and then in the VBI routine, it looks like:

```
Proc VBI_stuff()
...
[ RTI ]
```

So, I'm used to it! :)

Thanks again! I owe you one! (Or two!)

1934. Atari show in Dallas, Texas!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-14 00:00:00 UTC
From: smedley@gte.net
Message-ID: <5vho83$nu6$1@gte2.gte.net>
Source record: 70209
Cross-posted to: rec.games.video.atari,rec.games.video.classic,comp.sys.atari.st,comp.sys.atari.8bit

The Event:

Another reminder that the Atari Users of North Texas will be hosting an "Atari show" at the Infomart in downtown Dallas on Saturday, October 11th. While AUNT is primarily an ST/TT/Falcon computer users group, we invite all Atarians - 16 bitters, 8 bitters, and gamers (like me!) to attend. Attendance is FREE!

OK, I gotta admit it up front - the 8-bit computer line will not be very well represented here. In fact, I think my XEGS will be the only machine in this family around for you to fiddle with. But this is a great chance for us all to get together and share some stories. And if you want to bring some of your 8-bit stuff for swapping, post a note in comp.sys.atari.8bit announcing what you have to bring - perhaps some of us can get together and do some business on the side.

Other attractions:

We will also be hosting a pre-show dinner and a post-show dinner to give all Atarians a chance to relax and have dinner in a much more relaxed atmosphere. The pre-show dinner will be at the Hoffbrau in Addison, while the post-show dinner will be at the Bavarian Grill in Plano. If you would like to attend either or both of these dinners, contact David Acklam (see e-mail address later in this note).

At this point in time, we expect ChroMagic, Crawly Crypt, Systems For Tomorrow, It's All Relative, Emulators Inc., and Trace Technologies attend. (This is not set in stone - more vendors may be added, and some of these may not attend after all. I should have a more definite list for you in about a week. But these vendors all showed a strong interest in attending.)

What there is to do:

Along with shopping the vendors, we are planning a few software & hardware demonstrations, including an Atari internet demo (if we can get a phone line from the room cheap enough) and a big chunk of my personal Atari classic (and not so classic) video game collection - free to play all day, as long as you're nice to my stuff! (I'll also be bringing a little bit of trading stuff for any classic gamers out there.) Again, I'll have more solid info in about a week - stay tuned!

There are also plans still being hammered out for a free raffle and some game competitions. I am welcoming suggestions about what games you would like to play in such competitions, and ways to structure the

events. (Probably no prizes for the games - it will just be for fun.
But here's hoping we CAN manage to scrounge up a few extra prizes
aside from the raffle - anybody got anything humorous to donate?)

BTW, if you are not a ST/TT/Falcon owner, contact our vendors and let
them know what platform you would be interested in shopping for at the
show! For instance, I know SFT stocks classic and modern Atari gaming
stuff - their e-mail is sales@SystemsForTomorrow if you want them to
bring some of these items with them.

If you can't go, ADVERTISE!

And lastly, if you're a vendor and would like to place an ad in our
show newsletter, which will be handed out free at the show, contact
Dave Acklam ASAP! Rates a VERY CHEAP for this advertising, but it goes
to press very soon so contact him NOW! Last year we attracted Atarians
from all over Texas, Arkansas, Louisiana, and Oklahoma for this show -
let them know you're there to sell Atari products to them, even if you
are unable to bring your goods to the show!

For more info, contact:

David Acklam, President & Editor: d-acklam@ti.com
Dan Mazurowski, Secretary: smedley@gte.net

Hey;

It was brought to my attention that there was a wireless joystick for the Atari (2800, I believe). It used radio frequency to transmit the data to the base that connected to the console, unlike the infra-red or ultraviolet detectors used on newer wireless joysticks for PCs. Can anyone tell me where I can find one for sale, or a more relevant newsgroup to post this in?

Thanks,
Jared

No, we may not be able to explain it - at least we will all probably
have different feelings about them. Feelings, not hard facts. It really
saddens me to think that the current generation of kids (of all ages)
will never get to experience these (B)asic machines. For some reason,
when I do something on my Atari 8-bit, I often wonder how it does that
or can I modify it a little bit to do something similar. It generates a
sense of wonder and accomplishment. My 8-bit and I did something cool...
I never, ever get that feeling with my IBM (or the ST, for that matter).
Closest I ever came to poking around on an IBM is doing a SIO2PC cable.
Kind of like the old AM radio vs FM stereo receivers. How many kids try
to build a crystal set or a simple AM radio? Ever try an FM? No way....
Kind of rambling on here, aren't I? My kids grew up on Atari 8-bits and
it didn't seem to hurt them. I got enough stashed so my granddaughter
will have some to play with. The rest of the world may not be so lucky -
pity. When the redwoods all get cut down..... they're gone. Same for
Atari 8-bits, I guess.

Best way is to use an ICD Rambo upgrade. B&C and Best should have them.
Atari Classics has a battery powered 512K upgrade that you could use in
your 1200XL.

Any plans to post the instructions here or somewhere on a web site?

So far, I've been able to get decent ROM dumps from using an 800 and
CartCopy 2. I've managed to get Basic and Star Raiders (both unprotected)
to work, so I believe they should work straight on an emulator.

But if I'm worng on this, please correct me... :)

Source record: 70218

I have an Atari 800-XL system for sale - includes cpu, Amdek color monitor, 1027 printer, cassette drive, Rana hard drive, 1050 Atari hard drive (may be broken), joysticks, koala pad and all power supply units. With the exception of the 1050, all are in working order.

Also included is tons of software including Letter Perfect (word processing), Visicalc (spreadsheet), Data Perfect (database), and File Manager, all with documentation. Entertainment includes over 60 games such as Chessmaster 2000, Galactic Adventures, Battle of Geetysburg, Star Fleet I, Touchdown Football, Space Invaders, Pac-Man, Movie Maker, and the incredible UNIVERSE!
Documentation is available for all games as well as the hardware.

I would like to see these items going to someone who wants them rather than throwing them in the trash. Here is what I propose: Write, fax or e-mail me a bid on these wonderful items by October 15, 1997. The buyer will also pay all shipping costs. DO NOT SEND ANY MONEY NOW !! I will contact the highest bidder and then we will discuss payment arangements.
My addresses are as follows:
Howard Rand e-mail
HTR2001@aol.com
531 Falcon Avenue fax
305-592-9380
Miami Springs, FL 33166 phone
305-883-6222 eve

305-591-1553 3-5pm est
Send a self-addressed STAMPED envelope to me or e-mail/fax me your fax number and I will send you a complete inventory. If you have any better ideas on how to do this let me know.

Thanks for reading.

Well, it is a toy their selling after all, not a real robotic arm.

(BTW, I write the software for manufacturing controls which
occasionally involves work with robots. You should see the "Super
Armitron" they use in the clean room at Vistakon. I figure the arm
reaches over 10 feet high :-)

Funny you mention that, I just donated an 800XL and less than a half-dozen carts to the little 5- or 6-year old girl who lives next to my parents' place (considers them grandparents, more or less :))...

I've got a spare drive I'll eventually give her when I feel she can handle it, some games, and maybe (probably, knowing me :)) a book or two on BASIC. :)

I am willing to take offers on an Atari 5200 with the multi cartrige.

5200 4-port model
4-sticks (one for parts)
Still has box in great shape.
One stick works fine the others need the eraser treatment.
Cart has switches to select games.
Every game ever made for 5200 (except the sequel to Miner 2049er)

Serious offers only please !!!

Brian,
I'm assuming that you have converted these disks to .ATR images. If this is the case, most should work. Some ML programs may not, but... Since they were distributed with AtariDOS 2.x, you might want to try moving these images to MyDOS bood images. It might work better. Another option is to try another emulator. Try Rainbow or PC Xformer 3.60. I've tried some of my Antic disks with PCXf 3.60 and those seemed to work OK. I didn't try every program on them though. Voice synth programs like SAM don't work at all with PCXf, but other sound does (in most cases). I haven't tried Rainbow yet, but I hear it works very well. One of these days I'll unpack the file and try it out.

Bob:

Well put! You echo my sentiments exactly! The sense of wonder...

About 6 monts ago, I sold a complete 8-bit Atari system to some friends
for a few bucks... hoping they'd get as "hooked" as I was, years back.

I should have known: all they wanted to do was play games... and the
ones I had weren't FLASHY enough.

Worse: they didn't understand (couldn't FATHOM) that there wasn't a mouse!

Anyway, I will forever be grateful for my days with my Atari, learning all
about how computers WORKED. I have never regretted the time spent; almost
everything today can be related to the basics...

Thanks so much for writing! You brought back a world of memories!

Bob

In a previous article, rwoolley@pacbell.net (Bob Woolley) says:

A lot of it depends on your hardware, how you have it set up, etc. Some
sound cards do better with some emulators, for example. Nothing beats a
fast PC with lots of memory, but even with that, speed in emulation can
vary from system to system. I like XL-It!, personally, more than
XFormer, but I've been told that there are some areas in which XFormer
and Rainbow outshine XL-It!

Best advice is to get the latest version of several and try them all.
You will find that some programs work well in one, some in another, etc.

Message-ID: <341F283F.4E0A@mail.utexas.edu>
Source record: 70098

okay,

i'm just learning myself regarding hard drives and ataris, but here
it goes.

there are three type of interfaces...the mio (produced by icd), the
black box (by css) and the KPI (?). i have also read about an icd
interface produced by users in poland but have never seen one.

the KPI is rare.

you can get a black box from bob puff at css:

Computer Software Services
PO Box 17660
Rochester, NJ 14617
voice: (716) 429-5639 10am-5pm
fax: (716) 247-7158 BBS: (716) 247-7157
300-9600bps.

you can still find the mio's (multi i/o) from other users.

these are scsi interfaces that connect to the parallel bus interface
located on the rear of the 800xl. since there is no pbi on the 800 i
believe it isn't an option (though someone probably has a hardware hack
to overcome that)

the black box sells for $199.00 new. i haven't found one used.

i found an mio for w/ drives for $85.00, though i don't know if this is
really a going rate.

once you have it hooked up you need a dos (sparta or mydos seem to be
the consensus) to format/use the drives. dos controls upto 16megs, so
you can partition the drives if they are larger.

the difference between mio and black box:

mio's come in 256k or 1meg flavors, which can be setup as a ramdisk.

the black box offers a machine language monitor, screen dump, serial
port (upto 19.2k), a parallel port, an OS and some good extensions
(just what i have received, no personal experience)

all reliable sources have told me that if i have a choice...go for the
black box. i emailed bob puff at css, and css still actively supports
the black box...

still cost was a major factor for me...at least right now...so i went
with the mio...for now.

the atari faq has more detailed information.

thanks to :

I thought I knew all about transfers from 8-bit to IBM, so I attempted to help somebody who wrote to me with a problem null-modeming from an 8-bit to a Mac. He was using an MIO as his interface at the Atari end and BobTerm was his program. The Mac was running either ZTerm or ClarisWorks through the Mac Serial Tool. He could get what he typed on the Mac to show up on the Atari, using TTY, VT100 or VT102. But he couldn't get what he typed on the Atari to show up on the Mac. He was using a standard Mac serial cable, a standard Atari modem cable and he had a null-modem adaptor (probably the IBM type you can buy in the store) hooked up between them.

Both machines could use a modem successfully, so he's pretty sure that the problem is not in the MIO or either of the cables. He suspects the null-modem adaptor is the probem.

Oh, yes, both machines are running the same baud rate, the same duplex, and the Atari is set in ASCII translation.

I told him to try a standard Mac printer cable instead of the Mac serial cable and the null-modem adaptor, together with whatever gender changers he might need at the DB-25 ends. I vaguely remember that working for me many years ago.

Has anyone done 8-bit to Mac null-modem successfully? Has anyone had this problem when they tried and solved it? If so, how?

Thanks.

Have come across a nice XE Game system.With Keyboard.. comes with afore
mentioned and power supply plus video cable. 1 cart..Star Raiders.

Price shipped $35.00.

Still have a couple 800XL's at $25.00 Shipped

And a few 130XE's at $35.00 shipped.

1050 Disk Drive stock..at $25.00 includes power supply and SIO cable.

2ea 850 Interfaces comes with Power supply/SIO cable, may even be able
to come up with Modem Cable and printer Cable..

Yes these are .ATR files, but they are ones I downloaded from an FTP
site. They had a lot of Antic disks for download. I don't have the
disks anymore just the mags. :] I tried using Dos25 on Disk 1 and then
putting one of the antic .atr's in drive 2 and nogo. Also can't boot
with these disks. It's not a big deal if I get these to work, although
Warrior 3000 would be very cool to play again! If it's any easier I also
have access to the .bas files. I appreciate the help!

: Hi all,

: does anybody know how to copy files (D1: to D8:) without leaving BASIC
: (without using DOS). Must be a XIO-command - but I don't know the correct one.
: Please help! Thanks.

Thomas,

While there are XIO disk commands for format, rename, lock, unlock,
delete, open, close, get record, put record, get characters, and put
characters, I don't know of one for copy. You'd have to write a mini-dos
using some of the individual commands mentioned, or regular (non-XIO)
BASIC commands. BASIC is rather slow at this and you'd save time by going
to DOS and using the DUP copy function.

-to work, so I believe they should work straight on an emulator.
-
-But if I'm worng on this, please correct me... :)
-

It shouldn't matter if the cart is protected or not (except bank select) if you straight rom dump it the emulators should run them (when you insert a cart into an emulator, it protects the RAM that the cart runs in, unlike an actual Atari unless you have the pill or some similar device. If you look on Ivo van Porten's page, he has docs (I think) to build this type of device.)

As for dumping the carts, I use that old favorite, Omnimon to do so. I can dump any cart but bank select ones (only because I havent written the program to do so yet)

Now, now, let's not forget the venerable Corvus HD for the 800 or 400 for that matter. Connects via joy ports #3 and #4. A whopping 7 meg on my unit and you can even back them up with a VCR AND connect other 8 bits to it via a cute little networking box so you can share it.

Sharing is caring......

I've done just what you're talking about with no hitch at all. The only
difference was that I used an ATR8000 interface on the Atari. Bobterm and
ZTerm, standard cabling, a null-modem from radio shack. I think the highest
bps rate I could get to work was 4800. I used ymodem, too, for some reason.

A Mac printer cable is very different from a PC printer cable. On one end,
it has exactly the same sort of connector as the serial cable, since the
printer port is another serial port. You can in fact plug a modem in it and
use it like a second serial port.

Patrick,
There is a slight modification you need to do on the cable to make it work
with the PC. Go to http://www.emulators.com and get capture and print the cable
construction info. BTW, the XF Cable only works with PC Xformer 3.5 and above.

1986. FS/T: Atari 8-bit computer items [09/17/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-17 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <3424f032.6453467@nntp.ix.netcom.com>
Source record: 70114

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 09/17/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 6.00 Home Filing Manager, The (Atari)
$ 6.00 Print Shop, The (Br0derbund) {3}
$ 6.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 6.00 Timewise (Atari) {1}
$ 6.00 Touchdown Football (Electronic Arts) {2}
$ 6.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$10.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 9.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$10.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$14.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 9.00

*****

LOT #2

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 8.00

*****

LOT #3

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print" Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for 400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 8.00

*****

LOT #4

EPSON RX-80 PRINTER with built-in power cord.

$15.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address (this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 7.00

*****

LOT #2

COMMODORE MPS801 MATRIX PRINTER, with built-in power cord.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

I had thought of it, but A) I don't have the time to work on my
emulator, and B) I haven't got a working pthreads library that my
implementation needs.

I am looking for some Atari 8-bit carts that will run a 48k Atari 800. I especially looking for:

Crystal Castles
Bounty Bob Strikes Back
Satans Hollow

Check out my Atari page at

http://pilot.msu.edu/user/reicher6/atari.htm

If you have a game you dont see on my list E-mail me.

I am willing to buy, or trade. See my other lists for games I have to trade.

>heard, it does, but I just wanted to make sure. It plugs into the joystick
>port. Thanks for the info!

Wow the old smurf modem. I ran a BBS on one of those things back from 1983 to 1984 when I got an 850 and a 1200 baud modem.

Yes, it will work on the 400. If I remember correctly it plugged into joystick port #2, but that was a long time ago. I just remember I had to cut off part of the molded plastic connector to use it on an 800xl.

The MPP Smart Term cartridge should work as well, give you variable baud rates from 110-450. Pulse dialing, loud beep from the modem, and a nice smurf blue box.

Boy, those were the days...

Oh yeah, if I remember correctly, there was a baud rate compatibility problem with theMPP-1000c and the Atari 1030 (maybe the XM-301 also). The solution was to set the MPP baud rate to like 296 or something. It would cause xmodem checksum errors on file transfers which were really annoying. Didn't happen with any other modem brand.

Ken
ps - Are there any BBS'es supporting 300 baud anymore? Do any modems on the market support 300 baud anymore?

Well the incompatibility of Linux with the various buggy PCI main-boards is one
reason.

>> I never would have thought that the 8-bit fan culture was still so
>> active! Can anyone explain this?

Well most of what I use is old.I'm the Fred Sanford of electronics!
I'm listening to a real wood radio/8-track play with a silver metal front.
But I also have a Saturn,Playstation and Nintendo Ultra 64.And a remote
controled stereo/CD/tape player.

But the Atari was just great.I had only really used the Apple before that.
Wow,I was shocked by the detail of Draconus' and Zybex's monochrome graphics.
And all the COLOURS!

1992. Question: Commerce in this group...

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-17 00:00:00 UTC
From: Ed Haack <edhaack@ionet.net>
Message-ID: <5vptgh$k93$1@ionews.ionet.net>
Source record: 70120

Hi...

I'm curious. I'm rather new to this group, but not new to Atari 8-Bit systems (since 1982).

I see that a lot of folks use this group to sell and look-for hardware/software in, more or less, a garage sale format. There are very little actual deals, and more plain folks buyin' and sellin' stuff from one another.

My concern: Has there been much fraud reported in this group? I mean, folks that advertise, get someone to mail a check, and then not deliver as promised. I'm sure that this happens, and that no one takes responsibility for loss (who could?). Are we working on the honor system here? I sincerely hope so.

Yes, I realize that fraud can happen anywhere and at anytime. But how does everyone buy stuff from regular joes? Is there a way to send payment, the seller sends the product, and you confirm the payment once the product is received? (e.g. C.O.D.) I realize that the seller won't ship a product that isn't bought, but a buyer shouldn't send payment to an individual and "HOPE" that the seller holds true to his/her agreement.

What are your thoughts?

>>it was intended by Atari PROTECTED!!...

Well all systems are like that.Especialy Nintendo,even though the cartridge is
"protected".You just nudge it and it freezes on a note of some anoying music.
I also notice that ALL modern systems leave the edge connector open to air.
All the Atari cartridges I have like that,especialy Dark Chambers and
Flight Simulator,take some shifting around to get them working each time I play
them.(around a minute)
Needless to say that my Nintendo cartridges can take 5 minutes to get working,
since it's very hard to adjust the cartridge while it's in.And it took me a few
minutes to get my 32X "adaptor" working.

You'll find all variations and combinations of good and bad. As an
Atarian I'm tempted to say there's no such thing as a bad deal on
Atari 8-bit stuff -- only occasional high prices that are way above market
levels. Which is why it's best to read this base for a while and
get some experience in what's going on and what market levels are, rather
than jumping at the first message offering stuff for sale.

Atari 800 Dream Machine

Bob Woolley likes the 1200xl. He even can put a PBI on it.
BUT, here's a dream/questions. How come the 800 was never
capitalized on? How about the following dream Atari 800,
could it exist?

1. 4 256k RAM modules, total 1 meg memory, just plug 'em in.
Then, of course, renewed interest to write applications
that use this memory.

2. OS module with OSNXL and BASIC in it. Maybe even two or
three OSes, maybe the re-writable OS from B. Woolley.
SpartaDOS X already works with the 800. Again, just
plug it in. (Maybe some internal modifications.)

3. There is an edge connector inside, out the back of the
mother board. This edge connector has 27 contacts,
2 more than the 800xl PBI. Could an easy adapter from
this to a MIO or Black Box work, with the OS upgrade
from 2? Cut a rectangle in the back and plug in the
MIO/Black Box.

4. The 800 is also already very easy to find a problem
because of its modular design, just try the various
sections/modules until you find the part of the machine
that is the problem.

5. Personality board with, (what is it?) 65016, the CPU that
was in Apple][GS.

6. Ben Poehland makes an 800 video mod.

Such a machine/modules/modifications would of course be very
rare and unusual. It wouldn't be marketable. And if just the
video upgrade and PBI worked (PBI would require a different
OS), I'd probably do it and prefer it to any other A8 I
have.

Different people have different 'dream' machines. Right now,
that'd be my ideas for the ideal A8.

2002. volunteers required to test program

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-18 00:00:00 UTC
From: rje@co.umist.ac.uk
Message-ID: <RJE.97Sep18204026@co.umist.ac.uk>
Source record: 70035

Hi all,

Right, I'm looking for some kind volunteers who'd be willing to run a simple BASIC program against their atari 8-bit drives and send me the results. I'm really after people with double sided drives (XF551 and others), although I want to test it against as many different types of drives in as many different configurations as I can. I want to get info for at least: SSSD, SSED, SSDD, and DSDD drives. (Are there any other type around?)

All it does is request the status and configuration block information from the drive and then display it on screen. Am I correct in thinking that Standard 810 and 1050's don't have configuration blocks? (I don't have my standard 1050 with me at the mo' to test it), I'd still be interested in the status information returned by these drives though.

I've included a copy of the program along with this message or you can download it from:
http://www.co.umist.ac.uk/~rje/8bit/readcfg.txt

In order to run it drop down into BASIC, and then ENTER it from disk, switch the drive into the configuration you're going to run it against (ie. for DSDD put a DSDD disk in the drive) and run the program then send me the results along with the drive type and configuration. And that's all there is to it. Anyone want to help me with this?
All help will be much appreciated.

I knew a guy in '85 who did about $3000 worth of modifications to a
Commodore 64......

So if you can think it up, its probably possible.

My freind with the 64 had to connect a second motherboard and devote it
to controlling a larger memory. I dont remember HOW the glue worked,
but maybee something similar would be possible with an 800?

Yes, you raise very good points.. Internet e-mail dealings do have some
inherent risks. I, personally have sold to over 5 American Atarians (I
live Toronto, Ontario) and I always stay in touch to make sure they
receive their package) I am bought some ROMs (money order is in the mail
right now) a money order is better for both parties. Give the buyer a
receipt, and gives the seller access to immediate funds. I am very wary
of personal cheques because they can bounce and take a long time to clear.
(30 days for American cheques at my bank)

Basically, yes an honour system governs Atari sales... you could also check some of the classic video game home pages.. I know some of the authors have posted a blacklist of users that have cheated or attempted to cheat them. (it is a small list) I would argue most of the users here are an honest bunch, but there is always one or two bad apples that are out to cheat you.

(Also the biggest "deal" I have been involved in was about $30 US) I would be very cautious buying a systems that are hundreds of dollars over the net!)

Hello, folks:

I've got the following surplus Atari, PS/1, PC, Tandy, and RadioShack equipment I'd like to unload. The holidays are near, and this poor student could use some extra cash! (Hey, who couldn't?) In lieu of wrapping up this fine merchandise and giving it to family members for christmas (that didn't go over too well LAST year), I'll list them here in hopes that you fellow collectors will find something of interest.

Feel free to make me an offer I can't refuse! (Remember shipping costs.) This stuff, for the most part, is in good working condition. If anything catches your eye, Email me!

Atari

Qty Description
1 Atari 410 Program Recorder
1 Atari 1010 Program Recorder
2 Atari 800XL
1 Atari Disk Drive
1 Atari Power Supply for Peripheral

I thought of it. It's not quite as easy as saying "gee, I'll save memory to a disk". There are tens, maybe even hundreds of additional variables that would have to be saved as well, and a mess of crash conditions that would have be guarded against. Quite a pain, actually.

Still, it is something I've put some thought towards and in some future version I might implement it.

In answer to the second question, David is still developing Atari800, and I believe Rainbow is actively supported (although it might be considered complete in this version, I'm not sure). Markus is apparently on hiatus, so that's it. I intend to help David with Atari800, since that just helps Atari800Win anyway.

!!!WARNING!!!

First off you can buy cheaper from reputable dealers like cdw, necx, or try a www.pricewatch.com search.

The author of this post is Terry Ortman. A 38 year old, single guy, still living with Mom & Dad, who tries to sell lots of "adult material" and other equipment from Mom's house. He was banned by moderators of FidoNet, the Il. State Police have previously served him with a search warrant and siezed all of his equipment. He is now on UseNet where he has started over again. Do a DejaNews search from about 6/96 where he explains "how business works" which was why he took CJ Moody's (cjms@vnet.com) money but wasn't going to send him a refund or the $268 of equipment he purchased. Kubo complained openly on UseNet about not getting delivery after months. Terry "fined" him $250,000 and applied the money from his order to the fine! No joke. He is one strange boy. It seems he collects your money, THEN goes out and tries to buy the unit he sold you. If there is a problem, it was the "supplier" who ripped you off" not him.

For additional information try:
*DejaNews (around 6/96)
*e-mail the listserver at scammers@pdsig.com
*http://www.dynweb.com/theblacklist

This has been a public service announcement.

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

Probably. Well, maybe some of them will consider it now. (Which of
the emulators is currently still being developed, anyway? Apart from
the Win95 one?)

William Kendrick (kendrick@zippy.sonoma.edu) wrote:

: I've begun coding my Mah Jongg game. Nothing much, game-wise, but I've
: coded a pretty killer (so far) tile editor, so one (including myself,
: of course) can quickly and easily make cool graphics for the game. :)

I haven't bug-tested it much, but it works. Features of the editor
include:

Edit 16x16 b/w bitmaps (tiles for the upcoming Mah Jongg game)
Save tileset
Load tileset
Get a disk directory
Spiffy error trapping (one problem, see below, esp. Action! gurus)
3 cursor speeds (slow, medium, and fast)
4 cursor modes ("drawer," toggle, draw only, and erase only)
Nifty use of PMGfx
Nifty use of DLIs
Nifty use of VBIs

I may add some graphics manipulation commands (negate tile, flip/mirror
tile, copy/move tile, rotate tile) as well. I've already found that
copy can be quite useful. :) (I did a "Dominoes" set... I may do a
"Digital Numbers" set as well. Copy would be very useful for these.)

The ONE problem I'm having so far is determining the error code from
Action! I'm used to PEEK(195) in BASIC, but I can't find an Action!
equivalent! I'm of course using my own error procedure...

Works like this:

```
Proc MyError()
...(complain)...
WASERR=1
Return

...
WASERR=0
Close(1)
Open(1,...)
If WASERR=0 Then
...
Fi
...
```

During that "complain" bit, I'd like to be able to show WHAT the error was.
Where in memory do I look?

I've tried $49 (73) ERRNO, I've tried $C3 (195) ERRSAVE (of course.. my first guess!), and I've tried $2EA (746) DVSTAT (I think that was it).

Any hints? :) Thanks!

Look for my Mah Jongg game soon! Hopefully I'll get Gem Drop out before hand, since it's 99% done. I may end up releasing it musicless. <:^| Maybe a "deluxe" version'll have the music and a spiffy intro. ;)

Great. I'm looking forward to it.

Now, for the time being, would anyone who has access to the sources
for one of the emulators and who can get them to compile on his system
(the latter rules me out, unfortunately) be willing to create one (1)
specific snapshot for me - just a memory dump, no variables or anything
required? I'd be very grateful.

DT4 schrieb am Donnerstag in COMP/SYS/ATARI/8BIT :

D> I never would have thought that the 8-bit fan culture was still so
D> active! Can anyone explain this?

I think everyone using 8-Bits has his own feelings about his machine, here are some of mine:

1. For me everytime I'm using my XE or programm it, it's amazing to see that I don't need Pentium-power to get things going and what a great job those XL/XE-designers did. It's the art of programming to get what you want out of a machine you have and not buying a new one.
2. For me my XE is more reliable than every other machine.
3. When I start me XE I'm starting the BASIC-editor (I still have the original Atari-DOS). It seems to invite you to just try things out and build your own ideas. To do that on today's computers takes just a longer way.
4. I don't lioke the idea of forgetting a machine that was so useful for me over the years. And it is still useful for me.
5. Most of the daily work I can do with a Pentium (like txtprocessing) I can also do on my XE fast and reliable. That shows what agreat concept it is.

From: ai123@FreeNet.Carleton.CA
Message-ID: <5vsvar$au2@freenet-news.carleton.ca>
Source record: 70051

I've designed a AT keyboard <-> Atari 8 bit interface, is there
any real interest in my making a run of boards? I'm not sure what it
would cost since ive never done a commercial pcb run.

It allows the use of a AT (no XT keyboards) keyboard, and has eeprom for
saving custom macros (for all the extra keys :). I know the Transkey was
a similar device (though ive never seen one, or even seen one forsale),
but I dont know how popular it was.

I'll be posting plans for the whole device w/ the source code/image for the
eprom to my web site soon. If your interested seeing a production PCB
or whole device forsale in the future, let me know. I dont want orders,
or anything like that, just your opinion.

Thanks

Steve

I don't know how popular the device would be (except among 130XE owners
<G!>) but I do recall seeing several people asking how to get a Transkey
in this ng.

2029. Pong?

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-19 00:00:00 UTC
From: adliving@ucsd.edu
Message-ID: <3422b233.11139164@news.earthlink.net>
Source record: 70057

I'm looking to buy an old Atari pong machine, the home version. Small black box, 2 paddle controllers, its sole purpose was to play pong. If anyone can either tell me where I can find one, has one to sell, or can at least give me some model/system number of this thing, I would be VERY appreciative. Thanks a lot!

adliving@ucsd.edu

2030. FS: 1400XL, 815, ATR8000, PercomDD, Chalk Board

Newsgroup: comp.sys.atari.8bit

From: apalmer@zapcom.net
Message-ID: <5vub19$3n5$4@ultra.sonic.net>
Source record: 70058

I would like to sell the following items to the highest bidder. If you have bid on any of these items before, I apologize for not returning your e-mail. Please see my other post about problems I was having with internet access.

I have a 1400XL for sale. This is a real 1400XL that I got from Atari in 1985. The case is a 1400XL case but the 1400XL sticker was removed before I was allowed to take it from Atari. It works fine and comes with the "brick" power supply needed for the 1400/1450XLs. I had received a bid of $120 before I started losing my e-mail. If you are the person who made that bid, please let me know.

I have a 815 disk drive for sale. This is a double drive double density unit. It looks like a very tall 810 with two drives. Atari never sold these drives because of problem with manufacturing them. Very few of them made it out of Atari. The drive works fine but uses a special format that no one else used. When Percom started selling double density drives for the eight bit, they picked a different format and then everyone else followed. I had also receive a bid of $120 for this drive from the same person who bid on the 1400XL.

I have a working ATR8000 and a non-working ATR8000 for sale. These are CPM computers that are cabled to the 8-bits using the SIO. You can the use CPM on the 8 bit Atari computers. The ATR8000 has a built in floppy port, printer port, and serial port that can be used by the Atari. You can use standard floppy drives. If you want more info, I will pull out the manual and post the specs.

I have a working Percom double drive double density drive for the Atari 8bit computer. The model number is RFD40-S2. There is a standard ribbon cable connector on the back for using standard floppy drives. I added switches and leds on the front for power on/off and defeating the write protect of each drive.

I have a Chalk Board for the Atari 8bits with MicroMaestro, BearJam, Leo's 'Lectric Paintbrush, and LogisMaster. There are very good for young kids.

I will ship UPS-COD with you paying the shipping. Send me e-mail with you bids or any questions.

thanks,
al

I want to apologize to everyone who sent e-mail about the 1400XL and 815 disk drive I have for sale. I switched to a Falcon for internet access about a month ago. The Falcon kept crashing and causing garbage to be written to my hard drive, wiping out whole directories. I repeatedly lost my e-mail. Program would just stop working and I would have to reload software over and over. I have now switched to a TT for internet and everything should be stable.

<snip>

YES!!! :) My favorite Atari keyboard is still the 1200XL, but I don't use my 1200XL these days. In fact, it's not at my house, it's at my parents'.

I'm stuck using the ok keyboards of the 800XL (I HATE where they put the [BREAK] key! >:^( ) and I also now have a 130XE. Bleah! >:^(

How would it hook up? Directly to the motherboard?

Would it be something you could install inside and have an external connection for?

Will it use any software on the 8-bit itself? (I hope not, as that would kind of make it useless in many many cases. <:^( )

Thanks! :) Cool idea!

I like it! Steve, I think it's a kool idea, and I agree it would be
worthwhile making as a project if not more. What's on the board?
Can there be that much to the circuit? Count me in as a positive vote!

Right on the money!

I use my pentium every day, but my Atari 130xe is set up right next to
it, and it is still the machine I love. I word process with MS Word,
but have probably had less crashes with the old Paperclip program,
though I haven't used it in years.

It truly did invite one to program every time you turned it on. My
Pentium doesn't do that!

Steve, that sounds vaery interesting to me. Is it the kind of thing that would pretty much need to be on a PCB to be practical, or could it be put on some project board with much success?

Jon

Just reading and translating the keyboard was not a big deal, but after
that I wanted the eeprom for macros, etc and it pretty much ended up
being a sbc design. I'll post it to my web site as soon as I get a little
time to work on it.

Thanks for the feedback :)

If I run boards, you will have to remove the POKEY chip, place it on
the board, and attach a ribbon cable to the pokey socket. I was going
to just add an inline connector for the keyboard mylar, but I dont think
the sockets or strips are in production anymore.

> Would it be something you could install inside and have an external
> connection for?

I've laid out a space for a pcb din 5, so you could attach a keyboard
extension cable and have an outside connection. It would be just as easy
to use the connector on the board as a cable, and more durable imho.

The only problem is w/ the eprom, eeprom, etc, the board is going to be
larger than I want it to really be. Things will change im sure before
I put up the final schematics.

> Will it use any software on the 8-bit itself? (I hope not, as that would
> kind of make it useless in many many cases. <:^( )

No, its strictly a hardware thing. :)

: Does the MPP-1000C 300 baud modem work on the Atari 400? From what I've
: heard, it does, but I just wanted to make sure. It plugs into the joystick
: port. Thanks for the info!

Yup. Plug it into Joystick Port #2. I can't believe I wrote BBS
software for that thing. I also did a mod to install a switch that
toggled between the annoying internal speaker and a red LED. The thing
is interrupt driven and the frequency can't get 300 baud exactly right.
It's either too high or too low, so go with too low for maxiumum
compatibility.

Okay, it's working now, but I was wondering - are there any other terminal programs out there that support ANSI graphics (colored text) that would work with this modem? (considering this modem uses the joystick port, and not the SIO connector)- SmartTerminal (the program that comes with the MPP-1000C) is okay, but I would like something a little more powerful, preferably on cartridge but even on a single-sided disk. Thanks for your help!

The problem is, there's a local BBS that uses VT-100 and ANSI graphics,
and with the MPP-1000C, the codes normally used for colors just comes in as
garbage characters and jumbles up the screen and makes it hard to read.
Please let me know if there any VT-100 supported terminal programs that
would work with the MPP-1000C. Thanks!

-Sam

I used VT10SQ (VT-10 Squared - clever, eh!) on my Atari 800XL. It
had a software 80-column driver and it did decent VT-100 emulation for its
time. It's probably still on umich.

Are there any other terminal
programs out there that support ANSI graphics (colored text) that would
work with the MPP-1000C modem? (considering this modem uses the joystick
port, and
not the SIO connector)- SmartTerminal (the program that comes with the
MPP-1000C) is okay, but I would like something a little more powerful,
preferably on cartridge but even on a single-sided disk. Even if they
don't support ANSI, are there any good terminal programs anyway that would
work with the MPP-1000C? Thanks for your help!

-Sam

Bill Marcum mentioned BobTerm in a previous message. It's got the ability
to use that particular modem, as well as others. I once used the term
program that came with it, and Bob Puff had me change over to BobTerm.
While SmartTerm was a nice piece of software, it had the weird ability to
show the characters in that baud rate that you changed the software to.

For example, if you changed it to 110 baud, you would see the characters
go by at 110 baud. I nearly went to sleep when I changed it to 45 baud,
which is the speed of a TTY device the deaf use.

Then I sold it, and got an Avatex 1200 and 850.

I think Bobterm comes with an MPP modem handler, which could be used with
other terminal programs. I don't think there are any programs that support
ANSI color, but there are some that at least have 80 columns with ANSI cursor
control.

One day, if I get a good modem setup on my Atari (ie, >2400 bps), I'll write such a beast.. :)

All the "hard" stuff will be done on your Unix account (oh, you'll need a Unix account - shell access, particularly, and the ability to compile and install the "proxy" program which does the hard stuff, and which I'm about to explain :))

The system will be at least two programs:

(1) For the Atari - it displays the pages and lets you interact with them. Ie, it's your I/O device.

(2) For Unix - this is the proxy. You use the Atari to dial up to your Unix account and then invoice the proxy program. The proxy then handles all of the socket stuff (to download the pages and graphics), and converts the HTML into a simpler HTML or perhaps even a completely different layout format, understood by the (1) Atari program, of course.

As for graphics, it will download them, resize them to something more managable by the Atari, and then send them over. The Atari won't be doing any GIF or JPG decompression, and won't be doing any of the time- and math-intensive junk... just displaying a simple image in a format easily handled by the Atari. :)

Pretty cool, no? :)

I guess that means it won't be able to display any "offline" HTML stuff (ie, sitting on your Atari's drives). Oh well. :)

```
Announcing the First Annual Vintage Computer Festival!
------------------------------------------------------

Mark your calendars! The first ever public celebration of vintage
computers will take place at the Alameda County Fairgrounds in Pleasanton,
California this October 25th and 26th.

The Vintage Computer Festival (VCF) is the first event of its kind
anywhere in the world. This two day festival will feature presentations
and workshops by notable computer industry figures and vintage computer
hobbyists. There will also be an on-site, hands-on vintage computer
exhibition. Experiment with the classic computers of yesteryear!

Each year a computer from the past is placed in the Vintage Computer
Spotlight. This year we focus on the Apple ][. To celebrate the 20th
anniversary of this classic,

WE WILL BE GIVING AWAY AN ORIGINAL APPLE ][ PERSONAL COMPUTER!

Each person who attends the VCF is automatically entered into the drawing!

Both seasoned and new computer collectors will enjoy workshops and
panels to share ideas and learn about finding, acquiring, restoring,
and enjoying vintage computers. Visit http://www.siconic.com/vcf for an
up to date list of speakers and workshops.

The VCF also features the Vintage Computer Flea Market. Find those old
computers, peripherals, manuals, and programs you've been looking for!
The flea market is the ideal way for new comers to the field to start
their own collection or for seasoned collectors to add to their existing
stash.

Celebrate the good old days of computing! Attend the First Annual Vintage
Computer Festival!!!

When: October 25-26th, 9:00AM - 5:00PM daily

Where: Alameda County Fairgrounds, Pleasanton, California

Admission: Pre-registered ($SAVE$)

Individual: $15
Family: $24 (two adults and four children)

Benefits of pre-registration include:

o Access to speakers, workshops, flea market and
exhibition
o Pre-paid parking
```

To pre-register, send a check or money order to:

Vintage Computer Festival
4275-29 Rosewood Drive #161
Pleasanton, California 94588

Please make checks payable to "Vintage Computer Festival"

Print and mail the handy form at the end of this posting
for easy pre-registration!

At-the-door

o Speakers, Workshops, Flea Market and Exhibition

Individual: $10.00
Family: $16.00

o Flea Market and Exhibition only

Individual: $5.00
Family: $10.00

Please note: "At-the-door" rate is for a one day pass
only and does not include parking.

For more information including the latest list of speakers and workshops
please check out:

http://www.siconic.com/vcf

or send e-mail to:

mailto:vcf@siconic.com

If you are interested in vending at the Vintage Computer Festival, please
send e-mail to the above address.

SEE YOU AT THE VINTAGE COMPUTER FESTIVAL!!!

Harvey,
Sure it does. Most of us use PCs or some other system to d/l and
unzip the files. It's easy to x-fer the programs and files to the 8-bit
system once they're decompressed. PKZip packs files much better than ARC,
so d/l time is much shorter, especially on multiple d/ls and very long
files. Most of us use both (or more) systems. I personally use 3
different PCs, my 130XE and an Amiga. I'm sure ther are those tha use
MACS or STs too. It really does make lots of sence if you look at it this
way. I doubt that many users actually use the 8-bit systems to FTP files
from these sites. It's different with a regular BBS and y-modem or
x-modem. The 8-bit systems do well with them.

You could try FlickerTerm, which emulates 80 columns by rapidly flickering
between two images, emulating 80 columns. It does a very good VT100, too...
better than some commercial PC packages I've tried.

It should be at Umich.

Bobterm can show 80 columns with the XEP-80 interface, but it doesn't have
a software 80-column display. It's still probably the best all-around
terminal program, but for 80 columns try Flickerterm or Ice-T. Those were
written years after BobTerm, it took that long to come up with ways to do 80
columns in software at 9600 or faster.

I was reading the advocacy groups for Windows when I came upon a guy complaining about how is 5-page text file (actually it was a Word file so it's really binary) took up 120k!!!
It turns out that it's OLE's fault.
(OLE is for mixing text&graphics.I have something like that.It's call a GIF!)
The Word files actually are a file system unto them selves.It also had something to do with a "FASTSAVE" function.

Of course Windows doesn't even HAVE a text mode...

My objection is that the .zip format precludes Atari-only users from
accessing the Atari archives. If it is more convenient for people with
PC's, that is O.K. as long as there is also a format that can be used by
Atarians.
To lock out the people with the computer that the archive is meant for
is what I think is nuts.

Never thought of that one, using a proxy program to run on the remote Unix
shell to get the web pages and zip them over to the 8-bit.

I have an idea for making an interface to "read" HTML files from the Lynx
browser and giving it to the CAB browser on ST computers, so this sounds
like something I like to look into :)

BZZZT!! Thank you for playing... We have some lovely parting gifts for you backstage... <grin>

All Macs have two funky-looking serial ports on the back. One has a little phone icon above it (for a modem), and the other has a little printer icon above it. Macs use the printer port for networking with AppleTalk. Macs usually use AppleTalk to talk to printers and tell them what to do.

The modem port is a really nice one, although its missing a few important pins. You need a differently-wired cable for hardware handshaking, but this isn't such a big deal. Most modem manufacturers ship a 'mac version' of their modem, which includes the cable.

Sorta. Yah. :-) Its a funky-looking mac serial cable. Or its an AppleTalk cable, or a PhoneNet connector (which uses phone cable, like for telephones). Confused yet? :-)

I have been properly chastised for not asking whether anyone would be
willing to unzip some files for me.
Anyone out there willing to do so?
I would greatly appreciate it.

I ran across an unzip utility in the U. Mich. 8-bit archives.
Unfortunately, it did not come with instructions, so I don't know if it
would work on bootdisk.zip files or how to use it.
Does anyone know anything about it?

Thanks,
Harvey

The Mac's two serial ports (for modem and printer) are RS-422, but can be
used as RS-232 if the cable is wired the proper way, i.e., the recieve +
line must be grounded. Here is the schematic:

The ports as viewed on the back of the Mac and the 850:

Mac 8 pin mini-modem Atari 850 9 pin DIN connector
(or printer port)

Well, I thought so too until a friend of mine told me about
mah jong as a four player game, similar to poker, where you draw
tiles and combine them for gambling purposes. Supposedly mah-jong was
forbidden during mao era in China.

>: I've come across are (not on the A8), just a pairing of the tiles type
>Errr? :) That's all Mah Jongg was, I thought!

No it isn't. /Real/ Mah Jongg is more akin to (Gin) Rummy in it's play.
Sets of three or four matched tiles, or runs of three tiles. Played from a
hand of 13. Usually played, but not restricted to, four players.

There are several books available about the rules and strategies of MJ, in
the same way that there are books on Chess and Go.

>I mean, not exactly... you're constrained to only pairing tiles which
>are (1) not covered and (2) have a free space on either the left or
>right or both.

The type of game I've met on other platforms, yes. That is, a solitaire
game.

>Or do I just not know Mah Jongg? :)

No you don't. Not that that's your fault. I blame all the other
programmers that have called their game Mah Jongg incorrectly.

The adventure of opening boxes in the basement continues!

I have found the following items:

Atari CX 85 Numeric Keypad (in original box)
Atari 830 Acoustic Modem (in original box
MPP 156 Serial Adaptor
Mosaic I/O package for use with Atari controller jacks
Mosaic Adapter for Atari 800 Owners
Mosaic 64K Cable Kit #1
Atari Basic Reference Manual for 400/800
Atari Technical Reference Notes (shrink wrapped)

If anyone is interested, please make me an offer

Thanks

Jack

This sounds remarkably similar to the anonymous lynx server at Sailor. You can use any a8 term program that supports one of the supported emulations to telnet to 192.188.199.5. From there you can go to any http:// or ftp:// address. It renders the html pages into a text format. You can also download the embeded graphics for viewing offline. This does not require a lynx client, just a term program that supports cursor positioning, like ansi or vt100. Try telnet://192.188.199.5 to check it out. Then choose selection #1.

>
> 2) In order to run "BobTerm" do I need a DOS, or does the floppy start by
> itself?
>

Yes. BobTerm is not a self booting program.

> 3) Are there some Atari programs that won't run on my Atari because I have
> a Atari 1050 drive? (do some disks require a double-sided drive?)

The problem isn't the drive in most cases. This would come into play if you get DCM files or receive floppies that are formatted in Double Density or Double sided double density. Then you'd need a high density double sided drive like the XF-551. The big problem is that you are limited by the amount of RAM. Many programs require at least 48K. Many programs were written for the XL/XE systems and require the XL-OS and at least 64K of RAM

>
>
> 4) What DOS would you recommend for a 32K Atari 400?

AtariDOS 2.5 or MyDOS. If you were talking about an XL or XE, I'd highly recommend SpartaDOS, but it won't rin on your machine. (I don't know if the SDX cart would or not, though.)

>
>
> 5) How hard would it be to obtain an 80-column card for my 400? Do these

Hmm...just out of curiosity, I tried this with Oasis v1.35 on my Falcon, and
I couldn't get in. Not sure if telent thru Oasis supports VT100 though. I
don't think it supports ANSI... Anyways when I tried it went like this:

Login as "guest"
login:

So I tried guest, and it knocked me off. I tried "guest" and it asked for a
password. I gave it a <return>, #1, my E-mail address, nothing worked. Oh
well... :)

->Please let me know if there any VT-100 supported terminal programs
->that would work with the MPP-1000C. Thanks!

Around 1983 there was an Atari 8-bit terminal program put out called Chameleon (not to be confused with other programs of the same name for other platforms) which emulated four other computer types, including IBM mainframe. This program would provide you with the VT-100 capability you're looking for. It also has many features and options, handles various baud rates, and toggles between 40- and 80-column screen modes. The program uses the name "lizard" for its disk files.

My first modem was an MPP-1000C which was a trusty workhorse in its day, but seriously, 300 baud is extremely slow by today's standards, even for an 8-bit! 1200 and 2400 baud modems are worthless today -- you ought to look around for somebody giving one away, or look for a five buckeroni deal on an old 9600 at the flea markets.

Yes. But DOS 2.0 on the disk is defined by having a DOS.SYS and DUP.SYS. With
these 2 items then it will boot into the DOS menu (with Basic not inserted)

> 2) In order to run "BobTerm" do I need a DOS, or does the floppy start by

The BobTerm disk will atleast need the DOS.SYS file on it to boot.

> 3) Are there some Atari programs that won't run on my Atari because I have
> a Atari 1050 drive? (do some disks require a double-sided drive?)

Lots of answers to this one. I got a XEP80 module awhile back that really didn't
work well with anything. Your mileage may vary.

I would really like to get a copy of an old dos I once had. Atari DOS 1.0 (I think it's called). It is a single load DOS and DUP, so it takes more RAM to run, but I still would like to have it! Can anyone help ? Take Atarian care everybody!

==== end of session capture ====

Overall, it's just a great way for a8 owners to surf the net. The "[1] [USEMAP]" is actually an image map. The way the anonymous lynx server displays it allows the user to press either a "1", or use his cursor keys to highlight and select it. Then the screen clears and displays all of the links in the image map.

Sailor might have been maxed out when you tried to access it, or maybe something else was hosed up. I know of about 4 or 5 of these telnetable anonymous lynx servers besides Sailor.

An interesting footnote is that even though many isp's only offer slip/ppp accounts, that you can actually do more. What I did, was I dialed up my isp with my 8bit, logged in, and at the prompt where the trumpet winsock script would normally type "ppp", I typed "?". A menu of about 10 command was displayed, of which telnet was one of them. Using this I was able to telnet all over the place.

Bobterm, or any program written as a binary file, will start automatically if
it is named AUTORUN.SYS.

Did you say a 32K Atari 400? If I remember right, Bobterm requires at least
48k. But I don't remember there being any 400s with 32K. They were made with
either 8k or 16k, and an expansion board would give you 48k. Maybe you assume
it's 32k because FRE(0) in Basic is around 29000-30000?

The XEP-80 should work with Bobterm on any 48K Atari computer, but I don't
think it will work with an MPP modem. The XEP-80 and the MPP modem are both
designed to plug into joystick port #2.

PKZIP-Archivers.... I agree with you.. Sometimes I log on to some BBS' supporting a bit of Atari-8-bit. Well, they sure have a list containing all available files to download for Atari-8-bit, but... archived in *.ZIP!!

They could at least use LZH (LHarc) to crunch the files ! Compression is not as high as with PKZIP, but a lot more when using ARC...

And ofcourse, there is no LHZ-packer for 8-bit, be we've at least a De-Packer for that format. I'm using LHARC to crunch the data in my download-sig's at my Atari-8bit-only BBS. Till now I never had a file that won't decompres with UNLZH V0.1...

Just read about your "AT-keyboard at 8bit". I know about the transkey.
Has some nice features. In Germany they've also a PC->Atari interface,
but his one needs to be plugged-in to the 8-bit joysticksports...
When you wanna use it, you need a driver ofcourse. I think also a
modified o.s. is available with the handler already built-in...

The only little disadvantage using PC-keyboards at atari-8bit-systems is
the difference in the layout of the keys. I mean, when atari-software
says to press Shift-8, they actually ment '@' must be pressed. This is a
little problem since Shift-8 at a AT-keyboard is a '*' (asterix) :-))

On our visit to Poland we met a guy who totally rewired a XT-keyboard ! A
hell of a job, but it doesn't need an interface, nor a handler...
The Shift-problem was still not solved ofcourse :-)

If your idea is 100% based on hardware, I like it anyways. How should it
be connected to the XL or XE ? Is it to the foil-connector of the
original keyboard, or are you using something similar as used in the XEGS ?
(external keyboard without start-select-option, using 13-pole connection.)

If it's something like that, is it possible to use both the keyboards
without exchanging connectors ?

Are you releasing the project into the public domain ? Would be nice to
see such a project in the list of hardware-projects of ABBUC-Germany...

Some people might think it's nuts to spend $20/month for net access with a
$10 computer. :) (But I've been nuts for years.)
At present, if you have only an Atari, almost the only way to access
the Web is with a shell account, and most of those can unzip files
online (Delphi couldn't when I had an account there, but that wasn't a Unix
shell.)

: comes in as garbage characters and jumbles up the screen and makes it hard
: to read. Please let me know if there any VT-100 supported terminal
: programs that would work with the MPP-1000C. Thanks!

Set your BBS's account to VT only (ie, turn off ANSI) and use either
FlickerTerm-80 (which flips between two 40-column screens with fonts
that span only the left, and only the right half of the characters)
or Ice-T or Ice-T XE (128K RAM required) (which uses a 320x192 graphics
screen and some Display List manipulation to increase the vertical scrolling
speed probably, oh, 800-fold compared to other 320x192 text modes).

Both are excellent programs. Both are available at the UMIch archives:

http://www.umich.edu/~archive/atari/8bit/Telecomm/Terminals/

(via FTP access it's ftp.archive.umich.edu then "cd atari/8bit...etc."
although FTP access is extremely hard to get <:^( )

Unfortunately, I haven't used EITHER enough to get to know them very well.
They came out around or after my SX212 died and since the best Atari
modeming I could do was 2400 bps with a P:R: Connection. (My 14.4k that
I use with my PC refuses to work with the PR!)

Good luck!

I know there have already been many replies, but I've tried to sum them
up and give a solid URL for downloading the stuff. :)

I was wondering about a few things - I assume that most people in this newsgroup will have no problem answering these questions...they're probably really simple.

1) If I were to get DOS 2.0, etc. on a floppy disk, do I load it by just having it in the drive when I turn on the computer?

2) In order to run "BobTerm" do I need a DOS, or does the floppy start by itself?

3) Are there some Atari programs that won't run on my Atari because I have a Atari 1050 drive? (do some disks require a double-sided drive?)

4) What DOS would you recommend for a 32K Atari 400?

5) How hard would it be to obtain an 80-column card for my 400? Do these even work in the 400 at all?

Thanks for answering my questions! Please e-mail me at pbjurman@aol.com

I have the following items for sale:

Epson LX-86 Printer, 9-pin dot-matrix, includes removable tractor mechanism,
slightly used ribbon. Like new condition, looks and works great. I'll also
throw in an Ape-Face parallel printer interface to connect it to an Atari. $20

Okidata Microline 182 printer. Works. FREE!!! You pay shipping.
I've been trying to sell it for nearly a year with no luck, so
now I'm just giving it away.

Software:

Print Shop, with box and manual. $5

Print Shop Companion, with box and manual. $5

SynFile+, box and manual. $5

Paperclip, with manual and joystick port "key". No box. $5

Letterperfect, for 400/800, with photocopied manual in binder. $4

B/Graph, with photocopied manual in binder, $4

Flight Simulator II, cart,label torn. $4

Atari BASIC cart, Revision A. $3

Book: Inside Atari BASIC, $3

SAM, speech synthisizer, with manual. $4

The following disks are $3 each:

Bank St. Writer
Graphics Library #1 for Print Shop (I have two of these)
Graphics Library #2 for Print Shop
Graphics Library #3 for Print Shop
Christian Scenes & Symbols (Grfx. disk for P.S.)
Print Shop
Print Shop Companion
Tax Advantage 1984
Atari Timewise
Silent Butler (2 disks, counts as one)
Partyware (2 disks, counts as one, also runs on C64)

Prices do not include shipping. All prices are in US Dollars. I am
in Dayton, Ohio.

I also have some C64/128 stuff for sale. If anyone's interested please
inquire, or see my post in comp.sys.cbm.

THE SLANDER CONTINUES!!!!!

TERRY ORTMAN is a WORLD RENOWNED ATARI 8-Bit programmer!!

ANYONE who has bought STARFLEET SOFTWARE titles has been completely satisfied.

Ron Feiegn probably OWNS A COMMODORE!!!

Since STARFLEET SOFTWARE is the ONLY CURENTLY OPERATING COMPANY releasing NEW TITLES for the 8-Bit Ataris, as I said, ROn Feigen and this Robert guy are out to KILL the ATARI computers!!!

AS I SAID, ALL MY COPYRIGHTS WILL REMAIN VALID UNTIL some other comapny decides to PURCHASE them from me, for my ASKING PRICE!!!!

Until then, I will NOT stand by and HAVE MY NAME RUINED by LIARS who do NOT WANT ANYONE to get NEW software for their Atari 8-bit computers!!!!

RON FEIGEN IS VIOLATING DEJA NEWS RULES, every time he posts from there!!!!

YOU Can see him at the FBI's most wanted sites, read about him at www.scambusters.org www.ftc.gov and any other place that EXPOSES SCAMS on the INTERNET!!!!!

Terry Ortman is LISTED in Who's WHo in AMerica, and Who's Who int eh Media and Communications. Ron Feigen is listed in the FBI's MOST WANTED FILES, as well as WHO's NOBODY IN AMERICA and WILL NEVER BE ANYBODY!!!!

I'm going to put up a Ron Feigen Page, where you can all see his UGLY FACE, READ about his criminal violations, his child moestations, his sex offender crimes, and even send him FAN MAIL!!!!!!!

Has anyone ever beat Koronis rift (don't tell me what happens at the end)
how do you beat it at rift 20?

2120. HUGE RANT :) Keyboard layout for PC -> Atari adapter?

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-24 00:00:00 UTC
From: ai123@FreeNet.Carleton.CA
Message-ID: <609s2a$b6n@freenet-news.carleton.ca>
Source record: 69950

Since i've got the kinks worked out, and all the goodies are working now,
what do you think the layouts for the AT->Atari keyboard interface
should be?

Right now I have the default layout set so that the unshifted PC keys
are in the right place. For example, press 1 you get 1, press Shift-1
you get !, but press shift 2 you get " like the Atari keyboard, not @.

A better example might be the '-' key, its right beside 0 on the PC
keyboard. On the Atari this position is '</CLEAR'. Should it generate
'-' or CLEAR? What do you think?

The PC arrow keys are pre-programmed macros that generate Atari arrow
sequences, and all the keys that dont exist on the Atari can be programmed
to produce any key/macro sequence you want. I couldn't think of anything
special to use ALT for, so its programmable too. Mabey the INVERSE
key? It's set to '\' now (oops, there is a \ on the atari keyboard! doh!)

What about characters that are commonly used but arent on the Atari
keyboard, like the TILDE character? Typing a URL using the Atari keyboard
is annoying w/o it. I think TILDE is equivilant to delete or something
(cant recall at the moment :)

I think I will allow the whole table to be user-programmed via the keyboard,
but any thoughts on the default layout(s)? Mabey two layouts that are
user selectable?

Also what about the RESET/OPTION/SELECT/START/HELP keys? On my Foucs keyboard
there is a line of F-Keys on the left hand side that are 2x5, so assigning
these keys to F1/F3/F5/F7/F9 or F2/F4/F6/F8/F10 would put them all
in a position that feels right. The 1200XL F keys are assignable to any
key

What about a coldstart option? A real coldstart (not just CPU reset) would
require a few more parts, and a much harder install. Right now the
finished product will be a solderless installation if you have
a socketed POKEY chip. If you want the console keys on the PC keyboard
you have to make 1 solder connection for each one to/near GTIA (3 total + 1
connection to the RESET circuit, HELP is already part of the keyboard scan).

I could add another socket header for GTIA, but the board is already bigger
than I want it to be w/ the POKEY socket+header cable. Including the
POKEY there are 2 40-pin IC's, 1 28 pin, 1 14-pin mux, the EEPROM and
various gunk (crystal/caps, etc). Soldering the IC DIP header cable right
to the top of the POKEY might be an idea for people who cant remove the
POKEY, but seems a little drastic.

Using a little black magic I was able to figure out how to run from the EEPROM
and still be able to write to it at runtime, so I got rid of the program rom.

I think as-is it will end up being about 4x4, and i'm not sure a 5-pin pcb
din will fit into a 130XE, even near the back behind the keyboard so I
will use a cable connection to a female jack. Sound too big? It would
be no problem in a 800XL, 1200XL (ha), 400 or 800. How about a panel
mount 5-pin din w/ bolts? You could drill a 1" round hole and have a
PC keyboard jack on the back panel ;)

Guess you can run the ribbon cable out the front of the computer and keep
the board outside if your really cramped (read 600XL :)

Sorry for the huge rant :) Any feedback you have would be nice, and if you
know of a place that will make a few prototype PCB's for a reasonable
price (dont need to be plated through or anything yet) let me know.

2124. Re: HUGE RANT :) Keyboard layout for PC -> Atari adapter?

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-24 00:00:00 UTC
From: Fred Thompson <fhthomps@concentric.net>
Message-ID: <01bcc8d1$57314ca0$134badce@crc3.concentric.net>
Source record: 69954

My thoughts:

I really think you should stick with the standard PC keyboard connectors. There are two main types. The PS2 one doesn't take up as much room but is harder to work with (solder).

Keyboard layout? Hm, I'm partial to the layout as the PC has it because I'm used to it now. (It's also much more standard.) I like the idea of two default switchable layouts to support diehards. What about a user customizable layout? Don't some of the PC keyboards have that?

Wouldn't it be nice if somebody who has the ability to screen-print on keys is interested in helping on this project? Then you could get them with the appropriate graphics instead of the PC standards!

I think you're on the right track with the key layout you've described.
However, I'm partial to the PC keyboard mapping, especially location of
backslash and shifted characters.

Use the F keys for START, SELECT, etc, then leave remainder available for
programmable hot keys.

Use right ALT for INVERSE..

2127. 6502 multitasking OS

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-24 00:00:00 UTC
From: fachat@physik.tu-chemnitz.de
Message-ID: <60at5r$f4r$1@narses.hrz.tu-chemnitz.de>
Source record: 69957
Cross-posted to: comp.sys.cbm,comp.arch.embedded,alt.comp.hardware.homebuilt,comp.sys.atari.8bit,comp.sys.apple2.gno,comp.sys.apple2.programmer

[Note: sorry, if it's off-topic (in ..apple2.gno?), but I think you]
[might be interested anyway. please note if not...]
[for alt.comp.hardware.homebuilt: How's PRR doing?]

OS/A65

This is the announcement of my 6502 CPU Multitasking/Multithreading
operating system I wrote some time ago and which I have put on the Web.
It's copyrighted under the GNU public license.

For those who do not already know about it, please see the info at
the end of this text.

The new stuff in this version is:

There is a preliminary release of the new major release 2.0 of my 6502
operating system available for BETA testing. It features a new kernel
with threads, task priorities, a unix-like init task, unix-like
signals (with interruptable kernel calls) and it is much faster.

And the new version is much more portable than the old one. The source
has been divided into system dependent stuff and system-independent
stuff. Only in the arch subdirectory the different codes for different
architectures are located. And a porting guide - well, some comments on
porting to other platforms - is available. Currently supported are the
famous Commodore C64, as well as the Gecko computer and my selfbuilt
CS/A65 machine with virtual memory.
I am looking for volunteers to port it to other platforms!

You find it at the usual place: http://www.tu-chemnitz.de/~fachat/csa/

From the old announcement:

OS/A65

This is the announcement of "OS/A65", a 6502 CPU operating system
I wrote some time ago and which I now put on the Web. It is
copyrighted under the GNU public license.

Some of its features are:

- preemptive multitasking/multithreading

- (kind of) microkernel design

- filesystems for PC FAT disks and CBM floppy drives on a IEEE488 interface
or CBM serial IEC bus

- runs on 6502 computer with and without MMU

- developed on a selfdesigned and -built 6502 computer

- supports multiple platforms

If someone is really interested in, I can also write an article for
a publication or so about it. But, well, 8 bit times are gone...

I'm coming from the Commordore world, not from atari (8bit) nor apple side.
The hardware is close to CBM3032 compatible, but the kernel itself is
completely hardware independent. So just the device drivers have to
be rewritten for porting it to another platform.

It is a good machine/OS to do some small control tasks,
where you can watch them from another shell...
My computer controls my audio equipment via infrared signals ;-)

Well, if you are interested in, here is it's homepage:

http://www.tu-chemnitz.de/~fachat/csa/

so long

I'm interested.
Personally, I'd rather see the pc keyboard use all the pc characters, eg, a @ instead of a " for shift 2. I can't remember what the Atari was and it would be easier for me that way.
Oh, yes, you gotta have the console keys. f1, f2, f3, f4, f5, f6 for reset, option, select, start help would be easy to remember. I'm interested in this project because the 130xe keyboards aren't too hearty. I'd rather stick with an original A8 keyboard, but if the mylar or other reason the keyboard fails, it'd be increasingly hard/expensive to replace/repair.

I'm inclined to agree with James King on the right-ALT for the inverse
(Fuji key,) and his comments on the location of the backslash, etc., are
well-taken.

I'm also not sure that changing the Shift-2 to give a quote would work
for everyone. I tend to think of my PC keyboard in terms of a PC along
those lines, and I naturally go to Shift-2 for a quote when I use the
130XE. Others might react differently. It may be difficult to please
everyone.

Hey! Here's an interesting thought:

Suppose you use F1-F4 for the Atari console keys. Couldn't one of the
other function keys toggle between a PC keyboard layout and one more in
line with the Atari's keyboard? That might solve the Shift-2
controversy.

There's recently been a whole lot of Blue Atari T-shirts appear in the music stores (HMV, Virgin...) here in the UK. The T-shirts have an Atari logo on the front, with the word Atari underneath it in the Atari font, and under that in small writing it says copyright 1996. I was surprised when I first saw them, but they seem to be all over the place (I've seen them in 4 different shops). Question is where did they all come from? And how come they're being sold in music super-stores all of a sudden? Anyone know?

What products do you own the rights to? Anything I may have heard of?

>Terry Ortman is LISTED in Who's WHo in AMerica, and Who's Who int eh
>Media and Communications.

Well that should be pretty easy to check.

Here now in my hands I've got: Who's Who in America 1997 (the 51st edition),
Volume 2, L-Z.

On page 3225 I see Eldon E. Ortman, an entomologist and educator, and I see
George Earl Ortman, an artist, but no Terry Ortman.

Where exactly is your entry?

My library doesn't carry Who's Who in the Media and Communications, which is
a brand new publication of Marquis Who's Who, so I can't check there.

>either 8k or 16k, and an expansion board would give you 48k. Maybe you assume
>it's 32k because FRE(0) in Basic is around 29000-30000?

Actually, I remember having a 32K Atari 400. When RAM was really expensive
(in Atari'ans eyes), several companies made 32K boards. I bought one!

>>> 5) How hard would it be to obtain an 80-column card for my 400? Do these
>>> even work in the 400 at all?

Although I never saw one "in person" there WAS once a kludge-type board (never
in mass-production) that offered true 80-columns on an Atari 400. It was SO
big and unweildy, though, that you had to have the case and the metal RF shield
off the 400..!

Other than that, there were NO 80-column hardware adapters for the 400.

Sorry.

Hello, everyone!

In a previous article, ai123@FreeNet.Carleton.CA (Steven J. Tucker) says:
>Since i've got the kinks worked out, and all the goodies are working now,
> what do you think the layouts for the AT->Atari keyboard interface
> should be?

Well!

I hope this doesn't raise everyone's hackles, but: since most of us are
now VERY used to using standard PC's, wouldn't it be best to leave the
AT key-assignments the way the keys are stamped?

For example, moving the " character to a shifted-2 position seems CRAZY
to a touch-typist! I mean, we all complained about THAT when the Atari's
were NEW !!

My opinion would be to use F1 through F4 as Start, Select, Option and Reset.
Function keys F5 through F12 could be used for all Atari-specific keys,
and/or any AT keys that don't have ANY Atari-correspondence could be used
for practically any Atari-specific use.

I guess what I'm saying, too, is that if any AT-marked keys can be mapped
to the Atari, even if it means programmed key-SEQUENCES, they should.
(i.e., Page Up, Page Down, Home, End...) Just a thought.

Again, sorry if I'm "offending" anyone's Atari-sensibilities...

Bob

>I think I will allow the whole table to be user-programmed via the keyboard,
> but any thoughts on the default layout(s)? Mabey two layouts that are
> user selectable?

P.S. - Now, THAT's an incredible idea! TWO layouts!

>What about a coldstart option? A real coldstart (not just CPU reset) would
> require a few more parts, and a much harder install.

P.P.S. - I personally would like to have a true ColdStart.

It will be a 5 pin female keyboard connector, so you can just plug any
AT keyboard into it. Keyboards w/ the PS2 connector will just need the
regular ps2->AT adapter, a cheap item, and some keyboards come with it :)

> Keyboard layout? Hm, I'm partial to the layout as the PC has it because I'm
> used to it now. (It's also much more standard.) I like the idea of two
> default switchable layouts to support diehards. What about a user
> customizable layout? Don't some of the PC keyboards have that?

I dont think most keyboards allow custom layouts, my Focus 5001 lets
you program hotkeys and the typematic rate from the keyboard, but in
my experience its the exception.

I'm told the machine emulators already have a layout people are used to
so I might make the 2 default layouts 'standard PC' and 'emulator'. The
eeprom keytables can be reprogrammed from the keyboard anyway, but its
nice to know where to start :)

> Wouldn't it be nice if somebody who has the ability to screen-print on keys
> is interested in helping on this project? Then you could get them with the
> appropriate graphics instead of the PC standards!

It would definatly be cool to have little stickers for the keys, I remeber
having an Atari 400 w/ a real keyboard that had stickers like that.

I used to use Kermit 3.7 and OmniComm (Kermit when I needed to
upload/download using Kermit, naturally -- and using the keyboard macro in
OmniComm to have a macro set to "ATDT..." to automatically dial the phone
number). They used software 80 col. displays (not too good... but
legible).

: particular modem.

None? Then what do you call the MPP Express? I used it, so I should know.
I believe BobTerm allowed use of it, before I switched to an 850 and
Avatex 1200.

Then there was a BBS program, I forget the name, that actually allowed use
of the MPP. I used it. The MPP came with the SmartTerm software as well.
The wild kicker is that I tried once to copy the disk right in the store,
with the monitor off. I set it up, then turned off the monitor. That way,
if a salesman came in the room, I'd be doing something else.
Unfortunately, a salesman did walk in the room. I walked out shortly
afterwards.

I don't know if I still have it with me somewhere, but you can easily
check the Umich archives. Way back then, Bob Puff and I were in chat, and
he was actually pleading with me, asking me to change from SmartTerm to
BobTerm or MPP Express. That should give you an idea of how bad SmartTerm
was at the time.

I couldn't find the info about the keyboard.I looked in the for-sale section
but it was blank!!!
Aparently it just has frames and no text.Not even text saying that you need
frames.
(so that the smart ones will know to look into the raw HTML file for filenames)
How a Atarian is supossed to use frames is beyond me.Do you use some programme
that I can telnet (or,GOD forbid,Gopher) to that supports frames?
It's really anoying to type in all those filenames.
(you DO know that Lynx doesn't support frames?)

Well EVERYBODY knows that a BRK will cause that good old "*" monitor prompt to
appear on the Apple.(BRK=CPU tried to execute blank (zeroed) memory)
And the Commodore 128 has one too. (and it can take advantage of disk drives)
Well can the BB's "monitor" (though it's not actually part of the OS monitor)
be set (via the OS's BRK vector) to pop up on a BRK?

And what actually happens on the Atari (without BB) if a BRK is encountered?
Does it just RTI itself to death?

If you're talking about puting a cartridge in the right cartridge slot so that they don't steal control of the computer,you'll only be able to copy 8k cartridges.You won't be able to copy 16k cartridges unless they boot DOS. And bank-switched cartridges are out of the question.

Actually the receiver sends a "C".Of course the sender only pays attention when the user tells it to for obvious reasons.But this might be useful for automated situations.(most PC term programmes could be set to start Y-modem automaticly)

>send (upload). Y-Modem also has the benefit of faster transfer due
>to larger (1K) block size and 16-bit CRC error correction. If you
>must use X-Modem, select X-Modem 1K CRC mode (if you have it). It's
>almost as good as Y-modem, but is still missing some of the
>benefits, such as file size and auto name transfer.

Once again,COM files sent via X-modem will not always work.Of course everything should be ARCed.This means that EVERYBODY can download them (since Gopher and Lynx don't recognize the DCM extention as being binary) and insures data integrity.Makes downloads faster too.I wish that Yogi would realize that not everyone can unZIP and have access to a pay-ISP.
(I used Freenet for the longest time)
Of course I hate Gopher and Lynx.FTP has a nice interface that allows batch downloads and works with 40-columns.

Here we go! I finally have a list of vendors committed to attending the show. Chromagic, Crawly Crypt, Systems for Tomorrow, Emulators Inc (formerly Branch Always Software) and More Than Games. These names should all be familair to you ST computer fans out there. For the Atari gamers, Systems for Tomorrow also sells 2600, 7800, Lynx, and Jaguar games - contact them if you would like them to bring along a specific title for you. Sorry XL/XE fans, as far as I know none of these guys carry products for the older Atari computers. Hey, believe me, I e-mailed both Best Computers and B&C Computervisions to try to get them to attend the show, but neither could. (Come to think of it, I don't remember if Best even replied... I wonder if the address I used was any good?) But come on by anyway, meet some fellow Atarians and maybe strike a few trade deals. (And yes, fellow gamers, I will have some trade fodder along if you wanna wheel & deal!)

The show is on Saturday, October 11th, at the Infomart in downtown Dallas Texas. For directions or other info, contact:

Dan Mazurowski smedley@gte.net

Actually my BASIC manual refers to BASIC as a "pre-compiled" language.
(as opossed to storing the programme as text (files) like on the PC)

>"Compiled" usually refers to the translation of a symbolic language
>into a data format binary compatible with the processor (the
>"tokens" of the BASIC program have no direct equivalent to actual
>machine language, and as such have to be deciphered at run-time -
>therefore, the BASIC code has not been "compiled.") All that most

Actually C compilers (cc1) "compile" a C source file into assembly language,
not machine code.Of course the PC compilers (except GNU's) don't do this as
everything on the PC is just weird.
(no libraries,no support for graphics (except changing into graphics mode))

>non-compiling BASICs do is store a token for each command you input.

You just repeated what I said in my previous post.

>Some BASICs provide actual compilers to translate these tokens into
>actual machine language instructions, and it is the fact that
>run-time translation of these tokens does not have to be done that
>enables the speed increase (along with the ability to do more
>sophisticated optimization passes, etc. since you can take a little
>more time figuring out the best way to perform the required
>operations if you do not have to do it in real-time.) "Assembling"
>refers specifically to the translation of processor-specific
>commands to machine language. The only difference between
>assembling and compiling, therefore, is that "assembling" involves
>a direct translation from a mnemonic (i.e. LDA, STA, etc. on the
>6502, or mul, div, mov, inc, etc. on the x86) whereas 'C', 'C++',
>etc. (higher level languages) have no direct equivalent between the
>command being interpreted and the commands native to the processor
>(this is also why assembling takes way less time than compiling -
>99% of it is just a simple look up to determine what actual machine
>language code should replace a text string - although this gets a
>little more opaque as you come to the latest microprocessors, since
>they often like to have their instructions streams "formatted" a
>certain way for optimal performance.) Note that "compiling" often
>involves an intermediate step of translation between the high-level
>language and assembler commands (most C and C++ compilers actually
>translate their commands to assembler commands, and then assemble
>that, but the translation to assembler is usually transparent to

That's sort've what I said.

>the user.) Once a BASIC is compiled, there is no reason why it
>would REQUIRE a run-time library to operate (I'm sure some BASICs
>probably do need this, but that's simply because of the way they

Well remember that they just change the tokens to machine code.
The routines that the tokens cause to run are not included in the file.
It's like Linux and the Amiga.This means the files are smaller and you can
upgrade the run-time for increased speed.(and bug fixes!)
Of course in a multi-tasking enviroment,this also saves memory.
(except for UNIX and PURE Amiga programmes)

>chose to implement the procedure.) A BASIC program can be compiled
>just like any other program and any dependencies it has can be
>statically bound to it (so that it wouldn't require any run-time
>libraries.) - Loose

But then we'd be just like the PC. (ack!)

>tried using MYDOS4.5 but Xl-it refuses to boot with it.

If the hard drives are actually access as "H:",as you seem to indicate,then DOS
has nothing to do with it.The letter is used by the OS to know which handler it
should send the request to.Only devicespecs starting with "D:" will go to DOS.
"H:" is obviously some special handler that XL-It supplies.
It's up to DUP to access the H: drives.
Besides copying multiple files from H:,I would see no problem.
(since DUP would assume that only "D:" contains "files")

If the "Hx" drives show up as real physical (SIO) drives,then it should be a
matter of changing the allocation of disk buffers.But you'd be better off using
MyDOS,which has no limitation (of disk buffers).Remember not to use the MyDOS
that comes with APE.If XL-It doesn't work with MyDOS,which is pretty simple,
it'll probably be useless for games.
(remember:no high-speed SIO handlers!)

Just thought I'd would point out that the majority of this page (The
Atari B.A.S.I.C emulation page) was stolen from Atari Gaming Headquarters
(AGH), including the Best Electronics banner. They did not even bother to
remove the AGH title from the page! The ISP that this page is on has been
notified of the copyright violation.

Isn't this because HTTP programmes just connect long enough to get the file(s)
and then dis-connect?
I'll never understand why people want to put up FAQs and other important files
up on HTTP sites when FTP is so much easier and faster.

Well ATRs can only be 16384k long,for one thing.
Tell us what programme you are using to extract,and where you got it.
Some programmes are limited to 720 sector images.Others are limited to
128-bytes per sector images.

You mean without using "DUP".DOS is always loaded.The naming of the BASIC "DOS"
command comes from the (really) old days when DUP and DOS were one thing.
(I wished that DOS 2 had made keeping DUP resident a option)

Anyway,there is no copy XIO in DOS.In fact I've never heard of such a thing in
ANY OS or DOS except for OS/2.

>Sadly, all my manuals are elsewhere, ATM, so I can't refer to them.

SABYTE,which keeps track of the number of file buffers,is 1801.
(so if you "POKE 1802,3",you could have 3 files open)
DRVBYT,which is the number of drive buffers,is 1802.
POKE with 1,3,7 and 15 for 1,2,3 and 4 drives,respectivly.
You're only really supossed to have 6 buffers in DOS 2.5,total.
And you must press RESET to make the changes take effect.
IF you have a resident programme loaded at the bottom (above DOS) of memory
(like the RS232 handler),increasing DOS's memory useage will destroy that
programme.So you should really do this right after you turn on (or coldstart)
the computer.You can use "H" to write out the changes.

Of course you could always use the SETUP programme that comes with DOS 2.5.
It will do it much more quickly too.

A change of stripes here.... The information I posted the other
day about the Chameleon program providing VT-100 capability was all
well and good *if* you have a regular modem attached to the 8-bit.
I forgot that the MPP-1000 connects thru the joystick port; Chameleon
by itself wouldn't support that.

I downloaded the last version of PC Xformer (ever!).
I ran my old favourite,StarFleet,and OF COURSE no artefacting! (=no colour)
IS this really so complicated a feature to add?

And holding down the arrow keys to move the cursor doesn't really work.I ended up using my PC Gravis joystick ("joypad").
I mean I know that the PC keyboard is CRAP,but really.

And playing Ultima 2 was anoying,since it uses weird keys which are in weird places on the PC keyboard.(in addition to the strange placement of the double-quotes key and such on all PC keyboards)
And,of course,no colour.

(none in any of the Ultimas,nor Lode Runner)

And I ran into the weirditudes of the POKEY random number generation.The stars in Star Raiders kept forming into a diagonal line.(and it was QUIET)

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Come download Gem Drop, the newest Atari 8-bit game! :)

It is available as an ATR, zipped ATR, DCM or arc'ed DCM on my website.

http://zippy.sonoma.edu/kendrick/nbs/atari/games/gemdrop/

It will also be available on UMich as an arced DCM file.

Enjoy! PLEASE, tell me what you think, and feel free to upload it to your
favorite Atari BBS! :)

Well, if you're SMART that's the only way to do it, of course! But it's long been a cliche' of the programming world that many -- even most! -- programmers have traditionally SKIPPED that step, leading to programs which "work fine" as long as nothing goes wrong, but "don't deal well" with error/unexpected conditions. You'll note that there are MANY, MANY "real" software applications which crash for no good reason, and this is one big reason for it!

Hi!

I have just bought one of the 1400XL prototypes in great condition - the only thing is the missing silver label (Atari 1400XL) - BTW, yes it is a 1400XL, the motherboard says so and it has phone connectors on the back - so...

Does anybody on this planet have this silver label or a probably broken old 1400XL or parts of it he/she wants to sell. I really would like to get my machine completely fixed, so please let me know:

julian@factor5.com

Thanks in advance,

Julian Eggebrecht

Yes, Bill, I downloaded GEMDROP and ran it. I'm not much of
a gamer, actually and got to about level 3 at my best try out
of about 6 games. I did learn some stuff and was interested
in seeing your code. I learned how to change directories using
MyDOS. I would definitely say it is a game concept I haven't
seen before. Original. The sound was a bit mundane, but
appropriate. I liked the little guy (a multi-color player?),
he rubs his head when a gem hits his head. I don't do much
games and I don't program much games. But I like this one
ok. I liked it well enough to want to try Mah Jhong, which
I now see you also wrote. Where was I? Good enough for Antic,
not a commercial quality tho. IMNSHO (in my not so humble opinion.)
Good to see a new program for the a8, whatever it is.
Russ

2187. Help with software backup

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-26 00:00:00 UTC
From: itrek@mindspring.com
Message-ID: <342bfacf.10208955@news.mindspring.com>
Source record: 69837

I just pulled my old 800 out of the closet and cranked it up for the first time in about 10 years. I was suprised that the diskettes actually worked after all that time. However, I have a few diskettes that are now unreadable.

I don't want any more diskettes to go bad so I'm looking for a way to protect the old software by making backups to new diskettes. There's no problem with backing up unprotected stuff but I wanted to know if there is software available to copy the copy protected diskettes.

Thanks in advance for any suggestions,

itrek@mindspring.com

>Thanks for the info.

You're welcome, Bill.

>I'm tenatively _planning_ on _perhaps_ adding a "real" Mah Jongg

:-)

Check the rules out first.

>"card game" to the package, but since I had to thoroughly restrict
>myself on the number of tile faces I could use (10!), I may not be

Hmmm, a bit of a problem that; Mah Jongg has three "suits":

Bamboo, Circles, and Characters. Each runs from one to nine.

Then there are the honour tiles:

East, West, North, and South winds, plus Red, Green, and White Dragon tiles.

On top of that lot, you've got four seasons, and four (different) flower
tiles.

>able to. At least not a very good representation of it. :)

My guess is that it'd be difficult to get all 42 (different) tile icons
represented sufficiently well on an A8. A great pity. :-(

: In a previous article, kendrick@zippy.sonoma.edu (William Kendrick) says:
: >It is available as an ATR, zipped ATR, DCM or arc'ed DCM on my website.

: So, could you please explain the ATR and DCM formats?

ATR is a disk-image format used by most Atari emulators (PC Xformer,
XL-It!, Rainbow, etc.) and Atari peripheral emulators (ie, programs on
your PC which pretend to be disk drives, printers, etc.).

DCM is a disk-image format used by Atari's. There are programs to convert
DCM's to ATR's (very useful! :))

:
I'm not an XL-IT user but it sounds like the troublesome atr image you wrote about is un-bootable because it has no DOS. Copy an Atari DOS to the image if there's room, or copy the files to other images each with its own DOS. You might also want to include a menu program to display a list of files in the image so you can load a program without typing filenames.

Steven J. Tucker (ai123@FreeNet.Carleton.CA) writes:
> And what actually happens on the Atari (without BB) if a BRK is encountered?
> Does it just RTI itself to death?

When a BRK instruction is encountered by the CPU, the PC and Status registers
are placed on the stack and the OS IRQ procedure is called. It then
checks all the possible sources of an IRQ, and if none are found it
assumes a BRK instruction caused it, and jumps to the break vector
indirectly via $206/$207.

This location points to a RTI instruction by default, change it to anything
you want, just return via RTI.

"Tokenized" is, however, the more correct term.

> Actually C compilers (cc1) "compile" a C source file into assembly language,
> not machine code.Of course the PC compilers (except GNU's) don't do this as
> everything on the PC is just weird.

Almost every PC compiler I have seen has the *capability* of producing
assembly code, however.

> Well remember that they just change the tokens to machine code.

Most (but not all) Atari 8-bit compilers are actually bytecode
compilers: generally they compile to code for a 16-bit virtual
machine.

> The routines that the tokens cause to run are not included in the file.
> It's like Linux and the Amiga.This means the files are smaller and you can
> upgrade the run-time for increased speed.(and bug fixes!)

You can copy carts to files using the Bug/65 debugger which came with the
early disk-based version of Mac/65... Don't know whether it's still
available. Procedure is a little roundabout, but quite reliable and
doesn't require any additional hardware (other than of course an Atari
computer and floppy drive).

I missed the original post. I live in Rochester, NY and would prefer a
130XE to my (excellent working condition, stock) 800XL. Let's talk,
whoever is the original poster.

>

Isn't atrifacting a function of the TV/monitor? What I mean is that the color clocks aren't small emough on a TV to produce normal white so they are interpreted an the phosphore color (red, green or blue). On a PC with a very high res monitor, the phosphores are much closer together and ARE translated by the monitor as white. Since the Atari 8-bit resolution output is so low, the hi-res monotor actually does a better job of using the data and therefore doesn't display the artifacting like a TV would. Blame it on progress, not the emulator. If you have a CGA card and monitor, see if the emulator display Atari screens more like what you'd expect. I know this sounds wierd, but VGS is for much higher resolution displays than the Atari output generates and just doesn't understand the older display formats as well. Remember the Atari 8-bit was designed for TV, not VGA monitors.

>Pretty cool, no? :)

Very! This is an EXCELLENT idea/design. I'd almost suggest you quit
writing games and concentrate on this full-time! I will need a
precompiled binary for whatever my ISP host is (Netware version of Unix, I
believe... anybody know how to find out more?)! :-)

> >I guess that means it won't be able to display any "offline" HTML stuff
>(ie, sitting on your Atari's drives). Oh well. :)

Write a version of piece (2) that will run on the Atari? :-) Sure, it
will have to "do all that work" -- but not while stuff comes in over a
low-bandwidth modem line! So you don't have as low a ceiling to restrict
you... :-)

>

No, if I remember correctly, it only worked in the 800...but I can go check
;-)

I believe the 400 only has one 'slot', which was occupied by a single
memory card. The 800 had three slots, so it could have three 16k Atari
memory cards. If you removed the Atari memory card(s) and put a 48k board
in the first slot, and a loopback card in the second slot, that left the
third slot open for the 80 column video board. Also, there is a ROM card
in the 800...but you have to take the entire cover off to get at it...and I
don't remember but I think it was the same with the 400.

Both the 48k memory boards and the 80 column boards are available in
limited quantity if anyone is interested.

You will be extremely lucky to find one!

Most 1400's had 1200 tops installed, just the bottom case was the 1400
outer plastic. Only a handfull of 1400 decals were ever made for CES.

I bet you purchased A. Palmers console.....

A good 8-bit emulator should be able to simulate artifacting on a
high-resolution display.

>drives. (Are there any other type around?)

There are also 80-track drives.And even double-speed drives that run at
500000baud instead of 250000 for twice the storage.
(at least the BlackBox's "Deluxe" floppy controller does this)

>All it does is request the status and configuration block
>information from the drive and then display it on screen. Am I
>correct in thinking that Standard 810 and 1050's don't have
>configuration blocks? (I don't have my standard 1050 with me at the

Yes.The GET STATUS SIO command DOES give 2 bits indicating sector size
(128/256) as well as if it has 1040 sectors instead of the "normal" 720.

>mo' to test it), I'd still be interested in the status information
>returned by these drives though.

This sounds incredibly facinating.I've heard (from ICD manuals) all about the
incorect config info returned from drives.
(some drives won't give errors if you try to format in a un-supported format)

>I've included a copy of the program along with this message or you
>can
>http://www.co.umist.ac.uk/~rje/8bit/readcfg.txt

Does everyone really have HTTP access.When I first accessed this group I was
calling a Waffle BBS that got news through UUCP.

Net-Tamer V 1.09 - Test Drive

I'm re-editing this message.

I tried your programme in PC Xformer 3.60 and Xl-It 0.16.
Well besides returning corect information about density and sector size,
Xformer got everything else wrong!
And Xl-IT doesn't even support the "get configuration" command ("N").

And BOTH gave back weird nonsense "get status" info.The first byte didn't make
sense and the second didn't reflect sector size & number.
(bit 5 & 7,respectivly)

Oh,I'm back editing again!
I forgot to mention that my Trak drive doesn't access the disk when you issue a "get status" command.So basicly if it's in single density and you don't try to access (read/write) the disk,if you put a double density disk in and "get status" it will report a status of "single density".
My Indus GT drive would first access the disk
(if it hadn't since you put the disk in)
so that it could return the REAL configuration.

In other words:if the Trak didn't know the density because it had never looked at the disk,it wouldn't try to find out.But the Indus GT would
(rather mysteriously to me at first) start up the motor to check.

So the moral of the story is if you don't have a cool drive like a Indus GT make sure to do a directory of the disk you're going to test before you test it.

Can't you turn off ANSI on IBM BBSes?
Actually it's IBM graphical characters,not ANSI.
ANSI just moves the cursor and sets colours.

>Flickerterm or Ice-T. Those were written years after BobTerm, it
>took that long to come up with ways to do 80 columns in software at
>9600 or faster.

Kermit-65 will work at 9600 (never tried a faster modem) since it uses
XON/XOFF.

The problem with Ice-T,FT-80 and BobTerm is that they don't work with modern
modems with buffers.They don't activate the RTS line.So the modem appears to be
locked up.I always had to run Kermit-65 every time I coldstarted.
Also FT-80's inverse text is un-readable.It'd be nice if there was a option to
turn it off.

And Bob Puff says that the XEP-80 can barely keep up with 4800bps.
(the Atari comunicates with the XEP-80 at around 11000baud in bit-by-bit mode
using 9-bit bytes)

>the game. :)

I hope it's fast enough to be playable.Is it in graphics mode or multi-colour (IRG) text mode?

I had a Mah Jongg game on the PC.I played it on my Laser Compact XTE.
This is a PC with 640k (plus some EMS) of memory,EGA graphics and it has a turbo mode that makes it run at twice the speed of a normal PC.
But the game took FOREVER to draw the tiles.You could see the individual tiles being drawn from top to bottom.Sheesh!

Oh,it used 640x350x16 (4-bit planar) mode.That'a 112000 bytes of video memory.
(but a byte can be writen to several planes at a time)

>have 80 columns with ANSI cursor control.

You really don't want to use ANSITerm.It's pretty slow.
Ice-T is what you want.Or FlickerTerm-80.

You COULD have a coloured display by interlacing a GR.11 display with GR.8
You could use LMS instructions in the display list to alter the vertical
resolution from 200 to 25.But the colours would all be the same brightness and
quite dark.Poking 712 would lighten things but then you have grey instead of
black.And of course no white.

A better way would be to use GR.10 instead of 11.This would give you 9
colours/brightnesses.You'd use the 9th colour for all 8 high-intensity colours.
(perhaps making the #9 the famous Atari Rainbow;cycling through all 16 colours)

To explain:The PC text colours are made up of combinations of red,green,blue
and white("high intensity").So mixing R,G and B together gives you 8 colours
(two of which are black&white) and the white attribute doubles that to 16
"colours".So you really only get 7 colours (including B&W) and to lumnas.

ANSI only has codes for 8 colours.To get the other (brighter) 8 you set the
"high-intensity" (or "standout",in UNIX-speak) mode.Thus whenever we have
high-intensity set,the colour setting is ignored and we paint the character #9.

Of course this ALL leaves out setting the background colour of each character
seperatly.Even the mighty Commodore 128's RGB display can't do that.
But it would be nice for playing Nethack and such through telnet or BBSes,

For testing different luminances with GR.11,try out this:

```
10 GRAPHICS 11
20 FOR I=0 TO 15
30 FOR J=0 TO 9
40 COLOR I
50 PLOT 0,I*10+J
60 DRAWTO 79,I*10+J
70 NEXT J
80 NEXT I
100 POKE 703,4
110 FOR I=0 TO 15
120 IF PEEK(764)=255 THEN POKE 764,255:GOTO 120
130 POKE 712,I:POKE 764,255
140 NEXT I
```

```
150 GOTO 110
```

Just keep pressing keys to see the different brightnesses.
Line 100 causes the Atari not to leave graphics mode when you press BREAK.
You'll have to type "GR.0" or press RESET to get back to text mode.
(POKE 703,24 would also work)
You can use "POKE 712,2" to set brightness to level #2 and so forth.
(just stick to even numbers.Odd numbers are the same as the even one that came before them)

>wasn't a Unix shell.)

Actually for the longest time I used the Columbus Freenet.It didn't let you do
ANYTHING!
I used a Gopher FTP gateway to get files.Of course DCM files were off-limits
becuase the gateway didn't realize that it wasn't a text file and corupted it.
The same happens with Lynx.(through FTP,not HTTP)
There are other Freenets in other states too.The operative word is "FREE".

The author wrote it in C <blech!> from some book or text file he had.
But the C programme was only for the old way of ZIPing.
PKZIP 2 uses a whole new way of compressing files that's incompatible.
(though it will un-compress files using the old way)

>your help!
>-Sam

Actually there's really one unified way (not counting T: handlers) for modems
to work so all modern term programmes work with all modems providing you have a
R: handler for your modem.(BobTerm comes with a bunch of handlers)
This is the Atari we're talking about.Not a PC!

Actually R: is the RS232 interface handler.T: is used for Atari modems.
(except the SX212)
But modern term programmes expect a R: handler.
The handlers that come with BobTerm let your Atari modem look like a Hayse
modem pluged in through a RS232 interface.
The one for the 1030 (300baud,pulse dial only) modem does tone dialing by
having the Atari generate the DTMF tones and sending it down the SIO cable to
the modem and hence the phone lines.That's why the 1030 R: handler is so big.
(the 1030 has the T: handler built in)

You'd probably need to store it in a AM sound format instead of a FM one.
I don't think that Adlib could do everything that the POKEY did.Then again
maybe it doesn't have to for music.(really cool music,though)
Maybe a programme for playing POKEY-based sound files through the
SoundBlaster's AM circuitry could do the trick.
(would certainly make for smaller files than just recording it off of the
Atari)
But I don't know what Atari music format could be used for the Draconus/Zybex
music.I don't know if AMS & AMP support anything but pure tones.Maybe CMC?

>Yes. But DOS 2.0 on the disk is defined by having a DOS.SYS and
>DUP.SYS. With these 2 items then it will boot into the DOS menu
>(with Basic not inserted)

But you should get DOS 2.5.
DOS 2.5 with 6 disk/file buffers takes up as much memory as 2.0 with 5.
It also has a programme to set the configuration for you.(among other things)
And 2.5 comes with a DISKFIX programme that can save corupted disks/files.
Plus it can use single sided double density 128-byte sector disks.
(that is,what the 1050 gives you)

>> 2) In order to run "BobTerm" do I need a DOS, or does the floppy
>>start by itself?
>The BobTerm disk will atleast need the DOS.SYS file on it to boot.

Well then he would need DOS to run it.BobTerm has it's own DUP built in.

>> 3) Are there some Atari programs that won't run on my Atari
>>because I have a Atari 1050 drive? (do some disks require a
>double-sided drive?) >
>No. Nothing that I am aware of came out on Double Sided or even
>Double density disks.

A few games need double density (128-byte) disks like Phantasie.

>> 4) What DOS would you recommend for a 32K Atari 400?
>DOS 2.5 is pretty good and should run all the software you'll
>probably get.

Well some games need to be run from a boot-menu instead of DOS.
(they were never intended to be run from DOS)

huh?
If you mean PRO files then forget them.They're useless to a real Atari.
(unless someone comes up with a way to write them out using a Happy drive)
I just meant ATR and XFD files.

Also the DCMs have to be ARCed since several FTP programmes/gateways won't
recognize the "DCM" extention and download it in text mode.And why wouldn't you
want to ARC them.

Hey, I have to agree with you. If you look at all the keyboard layouts
in all of the emulators, you find that they differ slightly. You can go
nuts trying to please everyone if you make emulator layouts the criteria
for the keyboard.

2231. I had no clue that people still used the Atari 400/800!

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-27 00:00:00 UTC
From: Austin Franklin <dark4room@ix.netcom.com>
Message-ID: <01bccb45$98c54ba0$55c220cc@drt1>
Source record: 69863

Hi,

I used to have a company that manufactured/designed a memory board and an 80 column board for the Atari 400 (memory board only) and Atari 800 computers. It was nice to find this news group, and see that some of our products are still being used! We sold over 10,000 48k boards, and about 500 80 column boards!

We do still have a few 48k memory boards, and 80 column video boards 'in stock' ;-).

The demise of our Atari product line was commensurate with the release of the Atari 1200 (no expansion, and came with 48k already), and also Atari chose to sell through department stores. Previous to that, we had a dealer/distributor network upwards of 1000 resellers, but all of a sudden, we had less than one hundred. That, combined with this kludge of a computer, called the IBM PC, we decided to stop the Atari production. Those were the good old days.

The 80 column board was quite an engineering feat in its day (probably even today!). The code to run the board was very difficult. It had to exist in a bank switch cartridge, in the right slot, and take up only 256 bytes of space per bank...and run fast enough! That was probably one of the best pieces of code I ever wrote! If I find the code laying around, I'll post it. The hardware was quite high tech for the time too!

I'm really glad to see that some of our products are alive and well!

Austin Franklin

What a kick to hear from an early developer! My 800 is in the closet (I
have a 130XE right next to my Pentium) but it still works just fine. My
only forays into 80 columns have been in software like some of the more
recent terminal programs. It takes a bit of adjusting on the monitor
(or a switch to a monochrome monitor) to say that I can comfortably read
them.

Would you mind posting something about price and availability on those
boards? I'm sure that there would be interested people here.

Thanks.

Artifacting is a "glitch" that enables colors on Gr. 8 screens because the
rez is so high that it "bleeds" on TV's. Try to run Starfleet on a
composite color monitor and you get monochrome graphics. So programs that
use artifacting are merely taking advantage of this "feature" of crappy
TV's

Now, an emulator may be able to fake it by the way it interpetes Gr. 8
screen data. XL-it can do artifacting so try that. Of course, I doubt
Darek will ever made his emulators to be able to play games though he
claims otehrwise in his ads.

Lots of boops and beeps (Rainbow 1.4/Mac). Not bad. Reminded me of Tetris and Space Invaders. I had a bit of trouble getting the little guy to stop exactly where I wanted (maybe it's just my setup?) especially when he "wraps" from one side to the other. I think I would not have the alphanumeric characters animated--it looks kind of neat, but makes it a little too obvious how the animation is done. Also, it would look a little spiffier if the little guy "glided" when you moved him instead of jumping from one spot to the next in the character grid. All in all, I think you've created a pretty neat little game. (I liked the title animation also.)

Mark

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

$25 for a 48k memory board (with loopback for the 800), works in both 400 and 800.

$50 for an 80 column board....and an extra $25 for the cartridge to run it with an ATR8000.

Mind you, I really don't want to support these things....but I am willing to sell them with a return policy....say 30 days, full money back less shipping.

I'll post the specs for the 80 column board sometime within the next week or so...

It has nothing to do with phosphores.(?)
It's because 2 pixels share the same colour cycle ("clock") in 320x200.
That is,by the time the colour signal cycles,TWO pixels have been drawn.
Thus if you only set one pixel,only half the colour signal gets sent.
In 640x200,each pixel would take 1/4 a colour cycle to be drawn.
So by setting these half-clock pixels you can control what part of the
(white) colour signal gets sent.Ther are 16 possible combinations.
(this is what 128k Apples do)
In fact this is how low resolution graphics work on the Apple.You're really in
text mode (with the colour burst activated) with a different character set.

>Since the Atari 8-bit resolution output is so low, the hi-res
>monotor actually does a better job of using the data and therefore
>doesn't display the artifacting like a TV would. Blame it on
>progress, not the emulator. If you have a CGA card and monitor,
>see if the emulator display Atari screens more like what you'd

Actually I've hooked CGA (a Tandy 1000-something) to a TV and it DID do
artefacting.At least text mode did.I couldn't test graphics.
(BASIC is too incompatible on PCs)
By typing "MODE BW40" instead of "MODE CO40" you can turn off the colour burst.

>expect. I know this sounds wierd, but VGS is for much higher
>resolution displays than the Atari output generates and just
>doesn't understand the older display formats as well. Remember the
>Atari 8-bit was designed for TV, not VGA monitors.

That was my point.They need to add artefacting to the emulators since RGB
monitors don't support it.
(I heard that XL-IT does,but the only version I can find is 0.16)

Actually I don't think that RGB monitors even HAVE colour clocks.The colour is
controled by the voltage on the 3 RGB lines,not by phase.

Hello.

Before I go any further, I should, in fairness, note that I program for the ENEMY. (For the uninitiated, the computer I use contains a '64' in its name and begins with the letter 'C'.) :)

Anyway, I was wondering if the 8-bit Ataris can directly access the Internet w/o the usual circumventions, such as a VT100 accessing a UNIX host, etc.? I was hoping for a PPP access.

Can the 8-bit Ataris decompress 2.x ZIP archives?

Last, is the Omnimon (sp?) the only utility 'cartridge' out there?

Thanks.
-Todd Elliott
(In case if you're wondering, the ENEMY does not have PPP access and 2.x ZIP decompression capabilities.)

Not trimming, cause I missed the in-between posts, (but found them on DejaNews).

I speculate that PKZIP crashed in parsing the file names for some sort
of final directory totals or something ... who knows exactly, but
not many programs can handle that many individual files (about 6300).
It may just have been a conflict with QEMM7.5 .. I do have to use
the PKZIP switch to turn off 32 bit DPMI usage as a mater of course.

I mostly wanted the PkZip file as a means to save redundant backups easily
(it takes too long to do anything with 6300 files individually).
I've got it done, and have the files individually on the Zip disk.

My goodness, what a surprise! I used the Austin-80 board all the time, not only for 80 column text, but also as a second monitor for debugging. I could see the program's display through ANTIC on one screen, and the debugger on a second monitor through the Austin-80. It was a great setup, especially for 1982. I hear Windows is about to get multiple monitor support finally! (Yeah, I know it's not the same thing).

Some time in the '80s, I sent the right cart back to you for an upgrade, and you must have shut down by then because Fed Ex couldn't deliver it. I had them hold it while I tried to track you down, but couldn't find out where you moved to. When I eventually got back to Fed Ex they didn't know where the package was any more, and so I couldn't even get it returned to me! I've been without the use of the board ever since. I eventually replaced the machine with a 130XE and Black Box, and later with this custom 65816 based machine I'm using now, but I'd really like to rebuild the 800 system which had the Austin-80, Axlon-128, and Dave Small's LE Systems drive interface. Can we make a deal for a cart only?

Your best bet would be to get hold of either a Happy or Archiver modified drive. These two systems are capable of copying protected disks. I have two Archiver 810's, and consider these a sort of "poor man's Happy". They will make good backups, but with some programs you have to go through several steps. For instance, I made a backup of Gauntlet. Some tracks had 19 sectors on them, no problem. But one track had 20 sectors, which Archiver choked on. I went to the Archiver editor, custom formatted that track on the destination (after setting all the gaps to minimum), the track formatted ok, then I was able to copy that track over to the preformatted destination track.

I'm not sure how Happy would handle this, but for me the Archiver works just fine.

I think CSS still carries the 1050 Archiver mod. Sorry I don't have their address or phone number available, maybe someone could help with that?

Hope this helps.

Actually a better idea would be to boot off of a DOS disk and then switch to
get ATR file with the games.You might also look into boot loaders.
(some file games don't work with DOS)

Howdy folks

YEARS ago, I found a textfile that concisted of a bunch of messages (I believe they were compiled on GENIE. The names/handles concist mainly of characters, separated by a dot.) concerning memory upgrades.

One of the guys on there was called R.GORANSON2 or Hackman or HacksawXL. He talked about a certain upgrade using a 7404 and a 75LS373 (in a message dated May 11, 1991). He said he would upload a textfile shortly after that.

Has anybody ever seen THAT upgrade or THAT file? I'd like to look over it. Anybody ever tried this upgrade?

Why do I want it?

Well, when I first read the messages, I thought it would be a nice idea to multiplex PIA-pins that way. I didn't really understand what he was saying, but I liked it. Soon after that, I found out that people were already multiplexing PIA-pins. Then I found out that you can not access BASIC or get to OS-RAM while in banked memory. So I switched my brain into high gear (ye' should've seen the smoke!) and started thinking. And I came up with something. I needed a latch, but I don't know enough about hardware to find the right one.

So today I reread the message-file. And voila, the guy seems to be talking about the same thing I had in mind.

So now I want to hear and read
everything about this upgrade.

From my Virtual Garage Sale at http://www.seanet.com/~stevesk:
If you'd like to buy something, contact stevesk@seanet.com

Vectrex system 2 controllers, 1 controller new in box. Comes in
(loaded!) original Vectrex box with manual, minestorm overlay.
$250 Bundled with the following games (new in box): Armor
Attack, Blitz, Clean Sweep, Hyperchase, Ripoff,
Scramble, Solar Fox, Starhawk, Star Trek, plus (no box):
Berserk and Cosmic Chasm. With original Vectrex manual,
schematics, and catalog

Vectrex multi- Includes all released games on one cart (including
Cart 3D games). Homebrew, but works!
$50

Return of the Jedi Monitor needs adjustment, game works great. Obviously
Standup coin-op arcade this is big, so for sale only in Northwest. Buyer
picks
game. Up. Weighs a ton! Original cabinet, in GREAT shape!
$350

Colecovision System with two controllers, two super controllers,
(loaded) driving controller, and 42 carts (including rarities).
$175 Inquire for titles.

Atari 5200 Atari 5200 system with two controllers, and the
(loaded) following games: Beamrider, Decathalon, Dreadnaught
$170 Factor, HERO, Keystone Kapers, Megamania, Pitfall,
Pitfall II, River Raid, Space Shuttle, Berzerk,
Centipede, Countermeasure, Defender, Dig-Dug, Galaxian,
Joust, Kangaroo, Missile Command, Moon Patrol, Ms.
Pac-Man, Pac-Man, Pengo, Pole Position, Qix, Real Sports
Football, RS Soccer, RS Tennis, Space Dungeon, Space
Invaders, Star Raiders, Super Breakout, Vanguard,
Mountain King, Ballblazer, Astrochase, Frogger,
Montezuma's Revenge, Mr. Do's Castle, Popeye, QBert,
Buck Rogers, Congo Bongo, Star Trek, Zaxxon

Atari 7800 Atari 7800 system with two 7800 controllers, two
(loaded) paddles, two driving controllers, two keypads, the
$170 Star Raiders keypad, an Asteroids-style 5-button
controller, two mini Amiga joysticks, and a ton of
7800 games (most in box with instructions) including:

Double Dragon, F-18 Hornet, Kung Fu Master, Pete Rose
Baseball, Super Skateboardin', Title Match Pro
Wrestling, Tomcat F-14, Alien Brigade, Asteroids,
Ballblazer, Barnyard Blaster, Basketbrawl, Centipede,
Choplifter, Commando, Crack'ed, Crossbow, Dark Chambers,
Dig Dug, Donkey Kong, Donkey Kong Jr, Fight Night, Food
Fight, Galaga, Hat Trick, Impossible Mission, Jinks,
Joust, Karateka, Midnight Mutants, Motor Psycho, Ms.
Pacman, One-on-One Basketball, Planet Smashers, Pole
Position II, Realsports Baseball, Robotron, Summer
Games, Super Huey, Tower Toppler, Xenophobe, Xevious,
Waterskiing

Atari 2600 212 cartridges, some common, some much harder to find.
cartridge Included are a whole bunch of official Atari cartridge
collection holders (enough for all the games, with lots of room
$400 left over), which snap together to form a "wall" of
games. Only willing to sell as one big package (give or
sell the rest to your friends). Visit
http://www.seanet.com/~stevesk/2600list.html to see the
entire list.

Chase the Rare! Atari 2600 cartridge only available through 80's
Chuckwagon Dog food promotion. You won't see this for sale ever
$150 again!

Ghost Manor / From Xonox. Double-ended cartridge with two Atari 2600
Spike's Peak for games on it. Pretty rare.
Atari 2600
$25

Starpath with From Starpath/Arcadia. A cassette recorder interface
Suicide Mission for the Atari 2600. Several good games were released for
for Atari 2600 this system on cassette. I've got Suicide Mission for
$25 it.

TRS-80 Color TRS-80 CoCo II with JM controller, 2 disk drives,
Computer II with speech/sound card, direct-connect modem pack,
Accessories joystick, hi-res joystick interface, Programming the
$50 6809 book, EdtAsm+ editor assembler and manual,
schematics + tech info, speadsheet, 6 game carts.
Helluva system for its time.

Atari 5200 trakball In box with manual
$20

Atari 7800 trakball In box with manual
$20

2260. Re: Any comments on Gem Drop!?

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-28 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <60ka6n$cp9$1@nuke.csu.net>
Source record: 69876

James R. Gilbert (cb541@cleveland.Freenet.Edu) wrote:

: Yes, Bill, I downloaded GEMDROP and ran it. I'm not much of
: a gamer, actually and got to about level 3 at my best try out
: of about 6 games.

Wow.. heheh, you aren't a gamer (no offence! :))
Although, the only ways I've tried the game and played it well were
with Sega Genesis controller and under Rainbow and PC Xformer.
My keyboard controls for the game are kinda impossible to get used to.
I'll also have to try it with a _real_ joystick.

: I did learn some stuff and was interested in seeing your code.
: I learned how to change directories using MyDOS.

Hehe, that's good! Sorry my code is so comment-less. I probably should
have gone in (after the final compile) and added stuff.
I have a feeling I'll be releasing another version of Gem Drop some
time, so perhaps then. :)

: I would definitely say it is a game concept I haven't
: seen before. Original. The sound was a bit mundane, but
: appropriate.

Well, it was "good enough" when I coded it, so I left it.
It actually sounds a little different (deeper) when compiled with
the runtime library, but I liked it... you could tell pitch differences
more. (You may notice, the more gems that get destroyed, the lower the
pitch. If you get the "[!]" score (2000 or 5000 or 10000 points or
something; frankly, I've forgotten already!) it goes to an extremely high
pitch to let you know. :))

: I liked the little guy (a multi-color player?),

Nope... 4 multicolored characters, just like all of the gems.
Try opening up the "GEMDROP1.FNT" and "GEMDROP2.FNT" in a font editor.
(And remember, I edited them with a ONE-BIT 8x8 font editor! Not even
a TWO-BIT (color) 4x8 editor, and these are two-bit 8x16 shapes! :))

: he rubs his head when a gem hits his head.

Actually, he kind of puts his arms up like "Oh No! I'm getting crushed!"
and looks up in despare. This happens when the screen gets filled up
towards the bottom. He's happy if it's not, or if the clock is
running. :)

No mention of his little arm-thingy dance when you win, though!? :)

: I don't do much games and I don't program much games. But I like this one
: ok. I liked it well enough to want to try Mah Jhong, which
: I now see you also wrote.

I haven't written any Mah Jonggs which have been released! Are you thinking of MyJong? It's by someone else, and IMO, is an excellent and fun MJ solitare. :) I just thought I'd try to do something a little better (in some, but not all, ways) than MyJong.

: Where was I? Good enough for Antic, not a commercial quality tho.
: IMNSHO (in my not so humble opinion.)

Well, have you seem some of the recent commercial games?
Look good.
Sound good.
But usually Boooring!

Gem Drop is a game I enjoyed coding, I enjoy playing (OTHERS might not), and frankly, I enjoy than most of the recent (mid-90's) european games I've seen.

And you can't beat the price! :)

: Good to see a new program for the a8, whatever it is.

Of course. I doubt anyone here would disagree with that!

Does he move really fast? Or? What keys were you using? I was using
the alnum pad on the Mac, I believe...

> I think I would not have the
> alphanumeric characters animated--it looks kind of neat, but makes it a
> little too obvious how the animation is done.

What animation? Do you mean the "flickering?" If so, that's simply to
increase the number of colors. Did you set your "TV" setting to "Every"? :)

> Also, it would look a little spiffier if the little guy "glided" when
> you moved him instead of jumping from one spot to the next in the
> character grid.

Well, the best I could get was he'd move 2 1/2 steps instead of 1 whole step.
:)

> All in all, I think you've created a pretty neat little game. (I liked
> the title animation also.)

Thanks! I did it in 5 minutes in a paint program on the PC then whipped
up a gfx. converter in Action! and voila. :)

Well,yeh,I know what a BRK instruction IS,and how the Atari handles interupts,I
just wondered about the default.

>This location points to a RTI instruction by default, change it to
>anything you want, just return via RTI.

Which of course will cause it either execute another BRK or some random
op-code.(no such thing as a invalid op-code on the 6502)
It would be nice if it had SOME default action.PReferably something that let
you know that a BRK (a zero byte) got executed.Also with a address.

Are there any resident programmes that just handle BRKs and give you a
re-boot/reset/JuMP/DOS menu?
Perhaps it could fit into the tape drive buffer.(page $6 is over-used)
It would be small.The routine for converting the users ASCII numeric string
into a integer is built into the Atari.
(BASIC uses it too.That's why you can use REAL line numbers,not just integers)

>(at least the BlackBox's "Deluxe" floppy controller does this)

500,000 is the rate for 8 inch drives, double density. I think, perhaps,
(speculation) that the 2.88 meg 3.5 inch floppies may use that rate as well,
though they were not around in Atari times.

Though I do have a really strange 5 inch drive which emulates an
8 inch drive, and spins double speed if an ordinary 5 inch DD floppy
is inserted, so the data rate stays the same.

: On 1997-09-18 kendrick@zippy.sonoma.edu(WilliamKendrick) said:

: I hope it's fast enough to be playable.Is it in graphics mode or
: multi-colour (IRG) text mode?

It's going to be plain text mode. The font consists of the following:

4 characters for each face (2x2)
4 x 1 character for each face, top diagonal covered
4 x 1 character for each face, bottom diagonal covered

This is 12 characters per tile face. 128x12=~10. 10 tile faces. (Not much!)
This also leaves me 8 character spaces for the following:

1 background character (blank)
1 side-of-tile and bottom-of-tile character (white)
1 background character, top diagonal covered
1 background character, bottom diagonal covered
1 corner character

The first two and second two can actually each be one character
(side-of-tile/bottom-of-tile can be inverse of the background, and
the two diagonally-covered backgrounds can be inverse of each other)

So that's 128-120-3=5 characters left. I might use this for score. ;)

use XLIT 0./20 to my knowledge it is the only emulator that will support
articifacting.(lode Runner, GumBall, Drol look great)

Also to my knowledge digitized sound effexcts do NOT work with any of the
emulators. (GemDrop sounds are muffled and dont sound that great on Xlit)

Sometimes you just need the REAL thing.. but give the emulator
programmers due credit. its not an easy task

I am looking for the Atari 8bit version of Xenophobe (prototyped as an XED game cart in 1989) I have played the 2600 version (which is terrible) I would like to know if anyone has seen Xenophobe for the 8bit. And if it is for sale how much would it be.

>
> GET GEM DROP!
> http://zippy.sonoma.edu/kendrick/nbs/atari/games/gemdrop/

I tried GEM DROP with XLit 0,20 and Xformer 3.60... with Xformer the screen "vbibrates" its kind of a very cool effect (but its not intended) as I found out running it with Xlit 0.20. the digitized sound effects dont comer in properly with any emulator I tried, I would be interested to find out if the diugitized sound works on a MAC using rainbow. The game does not play perfectly on either emulator (as the game appears "different" depenbding on what emulator you use. (this Windows 95 keyboard are TERRIBLE! Ugh) Anyway, congratulations to Bill for a successfukl project, now all I had to do is fire up my real 800XL and play the game the way the author intended it!

Keep up the good work.

Hi Jerry,

Yes, I bought it from Albert - comparing the promo pics of the 1400 with my unit (as opposed to a 1200) it seems to have one of the "real" tops, since it only has one LED.

Do you know of anybody who found one of these labels or are they all confirmed to be destroyed?

Which would bring me to the idea, if one could manufacture such a thing...? Anybody with a 1400/1450 interested in such a project?

Julian

Op-codes that lock up the CPU sound pretty invalid to me. So do opcodes
that do odd albeit sometimes useful things, but break if the CPU is
replaced with another chip like 65802 or 65816.

John Harris Japanese translation of Microsoft slogan:

2282. Game Link II sample code

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-29 00:00:00 UTC
From: Jeff Potter <jdpotter@worldnet.att.net>
Message-ID: <60pko6$t7@bgtnsc02.worldnet.att.net>
Source record: 69813

Okay. It took a while to remember some of the little tricks in writing SIO bus interrupt handlers (like remember your interrupt routine is called *after* a PHA instruction has been performed). Here is actual Action source code for a really simple application. It reads the joystick and sends out a word which affects the color of the other's screen. As a check, it shows the color it sent as the background color on its own screen. If two Ataris aren't connected, the program loops slowly, and speeds up when a connection occurs (using the already mentioned GameLink II hardware available from your local authorized AGDA distributor :^)

BTW: if you wait too long after you've launched the program, attract mode sets in. Even though you are resetting the color registers, attract mode XORs your values with other ones. Press any key to stop this annoying behavior (actual fix is left to the student as an exercise).

This source will compile to binary executable directly (no need to include the Action library routines, I didn't use any). So after compiling, the program will run without the Action cartridge. You must press RESET after running this program to restore the default interrupt vectors.

Warning: this program only does what I set out to do, so modifications you make are likely to cause you a lot of grief. I can be of some help.

Hey I figured it out. I load up DOS 2.5 with no Basic cart, and set up
a virtual hard drive to my C drive and select L "Binary Load" then
type then name of the file .... "H1:JOUST.EXE"

=)

thanks.

I assume this version was mouse control also correct? That was the official released version of Ultima II for the ST and was pure crap. I heard a rumor that someone wrote the game as a learning example for TOS/GEM and then someone decided to release it at Sierra?? Ultima I wasn't produced for the ST nor was Ultima III(dont think). The ST got Ultima II, IV, V and VI. Ultima V was very buggy and locked up alot when a Shadow Lord is in a town. I never played Ultima VI even though it looked pretty good.

Probably some alternative music thing. I know I see lots of people here
at college wear stupid shirts with product logos from the '70s and '80s
constantly. Kind of sad that Atari has been reduced to that.

the board, and attach a ribbon cable
to the pokey socket. I was going to
just add an inline connector for the
keyboard mylar, but I dont think the
sockets or strips are in production
anymore."

The XE type keyboard connectors are
available at Best Electronics. There
Mylars are way to expensive to cut up
(US$22). And there isn't really a
lot of space to put an extra
connector between motherboard and
keyboard.

BTW I have two XEGS with keyboard, so
I don't need a PC keyboard. If I
ever want a detachable (sp?) keyboard
on my other XE's, I might try and
duplicate the XEGS stuff. Aren't
those XEGS keyboards using the same
cables/connector PC-joysticks use?

Howdy folks

Re: memory chips

I've been looking over this schematic
I drew after reading Bob Puff's "The
1-meg Memory Upgrade for the 130XE
that works!" (XETO1MEG.ARC)

And I came up with a couple a
questions:

When exactly does a CAS or RAS
occure?
Are all chips refreshed at the same
time? If not, how?

And I can not for the live of me
figure out how this thig with the
address lines works!!! I believe I
once knew it, but...

My books tell me 16kB x 1 chips have
7 address lines, 64kB x 1 have 8
address lines, 256kB x 1 have 9 and
1MB x 1 have 10 address lines. I
thought it went like "2 to the power
of (# of address lines)" but then
come up with only the square root of
the amount of memory the chips really
has.

BTW anybody know if a company ever
came out with a 4MB chip? Maybe pin
compatible to the 511000? And how
many Rollses or Rolexes I have to
trade in for these?

CU Mathy Van Nisselroy

PS how do SIMMS work? Can it be
compared to DRAM or SRAM?

PPS for those who know the above
mentioned upgrade: If we'd replace
the 256's by 4's, would it be
possible to throw the 158 out,

connect the lines that went to pins 2
and 3 to A9 and A10 and since we
don't need all them CASses, use one
of the line connected to the 138
(pins 1 and 2) to A11. (CASMAIN,
which is now "interrupted" by the 138
via pins 3 and 12, would have put on
pins 2 and 14)

PPPS Nope, haven't upgraded the thing
yet. It does this funny thing with
the BB now, and it's already
"STABLXL"ed. Have to order this
diagnostics thingie from Best I
guess. And my other XE's all have
64kB x 4bits chips. Maybe some
sockets and a small PCB is all it
needs to be upgradable.

PPPPPS Anybody found that upgrade by
R.GORANSON2 yet?

Howdy folks

I was looking over the schematics of
the 130XE (a far from perfect copy),
when I spotted something strange.

The FREDDY chip has 3 unused pins (1,
6 and I guess it's number 7 - real
bad copy ye' know). Does anybody
know what they were supposed to be
used for? (I believe I once heard
rumors that Atari had plans for an
260XE)

BTW on the PAL (CO25953) pin 12 is
unused while FOUR pins are connected
to ground.

Does anybody know more about this? I
just can not believe, that Atari
would have somebody make custom chips
and just leave pins unused!

You can telnet to freenet.columbus.oh.us for a version of Lynx with frames.
Just choose the "internet" section and you'll see Lynx listed.
but this Lynx doesn't have the "g" command.There's a site in the bookmark file
that lets you type in any URL and then makes a link for you to use.

Source record: 69734

hi,

> Please where can I find it?

probably you mean DYNAKILLERS which was made by GMG. you can find the
DYNAKILLERS DEMO on my xl/xe demos page:
http://www.tu-chemnitz.de/~sgl/atari/
enter demos and look under 'd'.

and ofcourse you can go direct to GMG's homepage:
http://econ.umb.sk/~mchorvat/
here you should find a link to the DYNAKILLERS FULL version which is in
the Slovakian Atari Archive. unfortunately the connection is sometimes
very slow, so if you have problems getting there i should research my
atari-stuff at home and will find the DYNAKILLERS FULL version too.
on request i will send it to you.

ok, that is all for now, bye, sven/CubE.

2297. XL-It

Message-ID: <01bccd72$72bbb000$9c22c5a9@CC2.azstarnet.com>
Source record: 69736

Does anyone know if I can connect my 8 bit machines to an ST SC1224
monitor?
Is it even a composite monitor? I know little about video signals so any
information would
be appreciated. I have an 800xl and years ago made a monitor cable for a
Commodore 1702
monitor with separate luma and chroma signals. I have this ST monitor just
sitting around
and it would be a pleasure to put it to use with an 8 bit machine.

Thanks!

Both the XL-IT and Genem emulators by Markus Gietzen have been temporarily discontinued. At this time, there is no word on whether either will be updated again in the near future. Markus had previously discontinued both emulators but then picked them both up again earlier this year. His decision to drop Genem may have resulted from some conflict with other emulator authors or continuing difficulties with the console "rom" crowd. Unfortunately, the much smaller Atari 8 bit community is now deprived of his work as well.

Neither of these things is available at present as far as I know; if they
ARE, or they BECOME available, I would sure like to know about it!

I'm also concerned about this "2.x ZIP" thing -- I've just seen it
mentioned twice here in THIS newsgroup, which is the first I've heard of
it. Am I going to have to go dig up new-and-improved UnZip
implementations for my numerous "obsolete" computers, now? *sigh*

> >Last, is the Omnimon (sp?) the only utility 'cartridge' out there?

Depends on your definitions. There were a couple of relatively simple (by
later standards) right-slot carts called "Monkey Wrench" and "Monkey
Wrench II," which I believe added some capabilities to Atari BASIC on the
Atari 800 (no "right hand" cart slot on any other model!). Do those
count?

>(In case if you're wondering, the ENEMY does not have PPP access and 2.x ZIP
>decompression capabilities.)

Actually, a gentleman named Andre Fachat posts here (and, I assume, in the
ENEMY groups) about having implemented a 6502 protocol stack complete with
either PPP or SLIP, I forget which. He says that he does not have an
Atari version but _has_ got it working on _your_ (cough) machine... I
have the URL _somewhere_ but heaven only knows _where_...

This is sad news. I was kind of hoping that Markus disappeared from the
scene to work on that commercial venture he mentioned and not because he
has given up on his emulators.

Markus, if you're still following the ng, what can we do to convince
you, and Mike Hill and Chris Lam and (dare I say it) Darek and the
others to keep us in mind?

First of all, thanks for your reply. The reason why I asked was that if there were such programs, I could d/l them and maybe do some disassembly or contact the author for some source code, and then adapt it for CBM 8-bit usage.

It would be nice to have 2.x ZIP archive (deflate) support, as it is essentially the defacto standard in the *cough* MSDOS/UNIX/WINDOWS/MAC world and the Internet. This way, cross-platform transfers are a lot easier to accomplish with our machines.

I assume that they are BASIC extensions. They do not count. :(I was thinking in terms of freezing, capturing memory, providing stealth ML monitor access to critical registers w/o disrupting the current program, ripping off player/missle graphics, by-passing copy protection, etc. Omnimom, from what I understand, provides this capability.

> >(In case if you're wondering, the ENEMY does not have PPP access and 2.x ZIP

Only SLIP. Also, Daniel Dallman has implemented SLIP access with a Telnet program. Hence, I asked for any info on PPP access using 8-bit 6502 code.

2308. Mac game programmers reminisce about Atari

Newsgroup: comp.sys.atari.8bit
Date: 1997-09-30 00:00:00 UTC
From: marksim@bitstream.net
Message-ID: <marksim-3009972301550001@port159.bitstream.net>
Source record: 69746

Today I saw an interview on the web of a couple of programmers who have just released a very cool Mac game called "Battle Girl". They pay considerable tribute to Atari as part of their inspiration and at least one of them first learned to programmed on Atari 8-bits by typing in programs from Antic. Here is the link:

http://www.transfixgames.com/interviews/ultra-united.shtml

The game itself looks and feels a lot like the early Atari vector-based games, but with a '90s attitude and a techno soundtrack.

What about the XEP-80 module? You may be able to get one of those to
work on a 400. I can't be absolutely certain of that though, as the
only Atari I've tried it on was the 800XL (although I may have tried
it on the 800 as well...)

>I forgot that the MPP-1000 connects thru the joystick port;
>Chameleon by itself wouldn't support that.

Doesn't it just use the R: handler rather than directly accessing the hardware?
BobTerm comes with R: handlers for most modems.

How well do you think it will compare to Activision's Shanghai for the
8-bit?

Will it support a mouse, trakball, etc. ?

Thanks,
John

I came across my old 130XE in the attic the other day, and was THIS close to throwing it out. On an impulse, I set it all up to have a look instead. The machine, disk drive, printer, monitor, joystick, and cartridges all work perfectly. The problem is, I have no disks anymore, not even DOS. I would appreciate any help in answering two questions.

(1) Are there FTP sites where I can get DOS and other software, and how difficult is it to do this via my IBM PC?

(2) What the hell am I going to do with an Atari 130XE?

I didn't know Activistion released it! I assume that the other games
called "Shanghai" were by Activision as well? (I saw it once on
an Apple II GS years ago, and on and off on PC's and Macs, too, I think,
but I never noticed who made it.)

Mine is being written mainly for speed. The other other Mah Jongg
games I've played on the Atari were MyJong (excellent game, but blocky
graphics and slow rendering) and I've seen Taipei XL once.

If you're willing to invest $20 or so in an interface cable, you can connect your 130XE to your PC and use the PC as a harddrive using the Atari Peripheral Emulator (APE). Once you have this set up, there are various freeware/abandonware Atari software sites, including ftp.hackerz.com.

I have this exact setup, with my 130xe connected to my IBM Thinkpad. I used APE to backup all my old floppy disk software onto my hard drive. It is definitely worth the time and money if you want to relive all your old Atari memories.

2331. Game Link II - Game ideas?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-01 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <60uacf$7dg$2@nuke.csu.net>
Source record: 69764

Ok, my first Game Link II game will probably be 3D pong. :)
I may decide to create two versions of it, just for you non-GLII people
out there (one would be two-player split-screen, the other would be
two-player, two screens (two machines)).

Before I start thinking of lame ideas, I want your input on what type
of GLII games I should consider writing. (Remember my programmling
limitation of course: I'm not a very good programmer. :))

For those who don't yet know, GLII is a SIO-based networking system
designed by the AGDA group. See the game Maze of AGDAGON for not
only an excellent example of what can be done, but also for instructions
on creating the cable. (I may make a copy of that document and place
it in "Info/Hardware/" on UMICH just as a reference. I've already
placed Jeff Potter's programming example under "Info/Routines/", and
as soon as I've perfected a simple Action! library based on it,
it will go under "Languages/Action/")

The simples GLII cable you could make, and which I will be using,
is made out of 2 SIO cables, a paperclip and some rubberbands and/or tape.

Oh, btw, please limit your current ideas to two-player (or at least
two computer) games, since that's all I have to develop with at this
point (both in hardware and software).

Thanks!

And thanks again Jeff! :)

Source record: 69769

I just plugged in the Atari 1050 single-sided disk drive that I found at a local thrift store, complete with power supply and cable that connects to the Atari computer. I turned on my Atari 400 and the disk drive after I connected everything. The disk drive spins, and the light comes on, and there is a slight normal grinding noise, but none of my cartridges (Basic and Atariwriter) that are supposed to use disk drives as well work. For example, in Atariwriter, when I choose Format Disk or Save Disk, etc. I get a "I/O Error". Same with BASIC, only this time it's Error 130. Can anyone help? The only possibilities that I can think of are that the cable is connected to the wrong port in back (which one is supposed to be used?), the little "drive select" switch is in the wrong position, or the disk drive simply doesn't work. Well, thanks for your help!

-Sam

From: Sean Lester <none@none.com>
Message-ID: <60v0t9$7vu$1@solaris.cc.vt.edu>
Source record: 69771

Has anyone had any problems getting certain disk images to work? I have tried to get Gemstone Warrior, Eternal Dagger, and Karateka to run but unfortunately cannot. Even on other emulators they do not work. In Karateka's case, the game loads but as soon as a key is pressed it crashes.

Any suggestions?

Also, if Markus won't update XL-it anymore, maybe we could persuade him to make the source code available so someone else can do it. Of all the emulators, his is nearly the most perfect(if that's possible). I feel with some concerted effort, the emulator could be made to run 99.9% of everything accurately.

Thanks!!

> preemptive means.

When processes are multitasked they are seemingly run in parallel. In fact they are being swapped in and out of the CPU based on some algorithm to make them APPEAR they are running at the same time. Cooperative multitasking requires a process to state it is ready to give up the processor and let another task get on with its work. Preemptive is much faster and more effective. It (usually) declares a time limit the process can stay in the CPU. If the task is not done by the deadline it is forcibly removed by the operating system and another takes its place. The process doesn't even know it has been put to sleep, so it thinks it has the computer to itself. Haywire applications cannot lock the computer anymore, either (in the sense of hogging all the CPU time).

Tom Hunt Sr. (tomhunt@bright.net) wrote:

: I vote that Gem Drop is the best new game of the year for the Atari 8-bit
: !!!

WOW! :) THanks! But wait, isn't the ONLY new game of the year?
What else came out this year?

: Man, if you would have created and sold that game in the early 80's, you'd
: be rich!

Heheh.. do you know many Atarians would be rich back then if they
did what they do today? Jeff Potter (APAC/ColrView), ALL the Euro demo
coders, YOU, I bet! I'd just be on the sidelines. :)

: What graphics mode did you use?

ANTIC mode 4 (Graphics 12, multicolored text). I flip between two
fonts to create the simulated colors (25 max, probably not all used;
the star-shaped GEM is the most colorful object on the screen)

Did you know the source code is on the disk? Hit [ESC] from the game
menu to drop down into MyDOS, then go into the SOURCE sub-directory. :)

Now, honestly, how often do you play the game, and for how long?
What's your high score? What level have you gotten up to? What level
do you usually get up to before dying?

(BTW, this question goes to all you GemDroppers)

I ask partly out of curiosity, and partly because I'd like to release
a "deluxe" version one day. :)

Jeff Potter (jdpotter@worldnet.att.net) wrote:

: Glad to be of help. Like I said before, don't casually modify those
: routines without emailing me. Like if you plan to send more than one
: word back and forth, and when you want to send it. Debugging code with
: SIO interrupts is non-trivial!

For 3D Pong, what you provided should be enough, I think. I may literally
send stick movement values back and forth, and the game will play as
if player 2's joystick is in the joystick port (heck, I may make it
play that way too, for GL2-less people... although I'd feel sorry
for the 2nd player. :))

I did write a simple demo which would only call the write function
when you actually wrote something, and I found the machines would both
freeze up until BOTH machines have sent something out, then it works
fine.

Also, at one point, both the background color and the border were
flashing..

although, nowhere in the code did it references those registers..!?
<:^(some VBI funkiness?

Hehe... not to ask too much (I probably am), you couldn't hack the code
TO send, say, fixed-sized packets to and fro, could you?

For example, say I wanted to send 3 bytes at a time:

(1) what the packet is
(2) byte 1
(3) byte 2

ie, in pong:

send(MY_PADDLE, my_x, my_y)
send(BALL, ball_x, ball_y)

or something...?

networking was always a pretty difficult concept, wasn't it?

I must say, I am more and more impressed by Maze of AGDAGON the more
I think about what it does...!

Oh, and btw, did you ever see, and do you know where I could get a copy of,
a Battleship game for the GL2? (THat was actually the first place
I had heard of it. Actually, maybe it was for the GLI... what's the
difference, btw?)

Thanks!

: and/or the interface cable?

APE works with all Ataris. You of course need a PC to hook it up to.
It works with all PC's too! :) I run it on my old 8086-based IBM PS/2
and it works great!

You can get an unregistered shareware copy of APE from UMich.
The documents have instructions on building the "APE Pro" cable,
but you can also use an SIO2PC cable (I do), which is described in
the SIO2PC package, also available at UMich.

Point your FTP client to:

atari.archive.umich.edu -- under: atari/8bit/Emulators/Peripherals/

or your Web browser to:

http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/

Good luck!

Well I got XL-IT 0.20.
No way to swap Artefacting colours.
(XL/XE artefacting colours the reverse of the 800's;you'll get blue grass and green water in Ultima)
But worse yet,the brightness (of both GR.0 & 8) is stuck at 14!
So StarFleet has to be played without artefacting since it uses black text & graphics on a white background.Just try poking 709 to see what I mean.

And still a really anoying interface.Why make you press "ALT-letter" when "letter" isn't even used for anything?!?

Well,at least Ultima 4 was fun to play.Even if it can't do sound.
But the weird PC keyboard makes Ultima 2 really hard to play.

55 milliseconds. THe PC BIOS timer tick count is incremented this often.

>What if the person doesn't have a VGA card?

Then eh may have to use a different strategy when talking to the video
card's hardware. However, virtually any PC today have VGA video.

>What if they don't have ANY video card?

If so, he'll need to get one, or else the BIOS will halt during bootup
since it cannot find any video card. The same will happen if a keyboard
is missing.

The minimum PC hardware configuration is a motherboard, a power supply,
a keyboard and a video card. Unless you're running an original
IBM PC/XT/AT, you'll also need at least a floppy drive controller + an
attached floppy drive, or else the system won't start (on an original
IBM PC/XT/AT without any drive, floppy or hard, ROM-Basic will be
started).

hi all,

i need some help setting up an mio-adaptec-mfm/mfm drive system.

i have a 35 slot cable daisy chained from drive 1 to drive 2.
i then have a 25 pin cable from drive 1 to the adaptec 4000a.

a 50 pin cable runs from the adaptec to the mio, finally the mio runs
into the pbi on an 800xl.

the previous owner said i need to boot up the mio and change the drive
specs to make d1: be a bootable floppy...how do i boot up the mio?

once that is done, do i simply address the drive as d2:, d3:....etc?

thanks,
robert

Get everything properly cabled and terminated, then ensure you're
connected to your 8bit correctly.

Power on the MIO first, then power on the Atari. Hit RESET/SELECT. You
should get the MIO config menu. Enter in your drive informatin;

Example:

ST251: 820 Cylinders, 6 Heads

Drive1 (16meg): Start: 1 End: 65535

Then get your MIO software out, lowe level format the HD, then use a
formatter to put the appropriate OS on the disk.

Incredible.The Atari's software maintained real-time clock had a 1/60th of a
second cycle.(it was maintained by the vertical blank interupt routine)
The hardware timers had much more.

I'd like to see a new MyDOS with new features added.Basicly a PRO-DOS.<heh>

Like the ability to truncate files.You'd just POINT to the part of the file that you want to be the end and you execute the XIO that will change the "number of bytes in this sector" and the "next sector" bytes to the new values and then go through all the next sectors to delete them from the VTOC.

Also a mode 13 (read+write+append) like DOS 3 has.So if you tried to write (but not read) past the end of file it would automaticly switch into append mode.

Also a way to indicate the last sector in the file when you opened for mode 9 (write+append) so that it could go directly there instead of going through the entire file.Of course the programme would have had to had been at the last sector previously to know what it was.

You have a floppy disk drive connected to the sio port set as drive 1,
select the first drive
on the MIO as floppy and d1:

The 34 pin cable attached to the MFM mech and the Adaptec, you also have
a 25 pin ribbon
cable to the 4000a. set the first drive as d0 or d1 as you want to call
it..attach it to the outter
25 pin set on the 4000a. The second drive you need the 25 pin cable
attached to the inner
pins on the 4000a. Then you need to go to the MIO menu and select the
next drive which
will be 2, set the heads and cyls, then sectors..If a large drive may
end up being more drives
than just one...set the unit id as 0, 0..when you get to the second
drive set the id to 0,1 and put in heads cyls, and starting, and ending
sectors..you can not go over 65535, actually 65536
sectors, which is a little over 16mg..so if you have a drive larger than
10 megs you need
to split the drive into 2 drives.

Clear as mud?

Generally speaking, one uses custom/specialized hardware. Typically this means one of the several disk-drive hardware modification products.

>Moreover, how to make programs which check for
>their presence work?

Assuming you're speaking of a machine-language "binary executable" program (boot disk, load-and-go file, etc.)... Run a debugger or machine-language "monitor" program. Use THAT to load the program you want to "make work," then single-step through the program, find the point where it encounters the bad sectors, determine what response constitutes "success/proceed" (as opposed to "failure/lock up"), and replace the bad-sector-check section of code with new code that ALWAYS delivers the "success/proceed" response, whatever it may be. Write the new code back to a new (or the same) file.

Try Time Line in Texas they had some 4000a's and 4070's a while back but
I do not have
their phone number.

Also reference your first post..now you have it up and running, format
out the hard drive
with your dos preference then write dos to it..if you use sparta copy it
over and install it.

then go back to the Mio menu and swap d1: with d2: if you have written
dos to it properly
it will boot from the hard drive when you turn on your computer...??
Drive 2 will now be the
d1: floppy drive. Clear as mud again?

The latest Ice-T has a bare-bones Zmodem download. Then there's Larry Black's Atar-Z-Modem, which is a more full-featured, stand-alone Zmodem downloading application.

Missed a portion of the Original Posters message..

As to the SIO Ports on the 1050, it does not matter which one you plug your cable into all
circuits are the same..you can plug in additional drives ect to either port and it will function
properly..provided they are set to a different number as in a disk drive..D2: Other items do not require you to address them as D1: or D2:, D3: or D4:..

Just to cover uncovered items..

(D. Kluge says SD X open for r/w/append is faulty.)
Yep. I checked it. Does exactly what you said.
ICD crazy!? Oh, well.
You have SDX and use it and MyDOS, so I think you're in a good position to evaluate. And I don't put down any DOS. My first DOS, SmartDOS, I like it very much still. It got poor reviews at the time I got my Rana 1000 in 1984. I don't think there was another dbl. density DOS at the time. SmartDOS is still a good DOS.
But, I have some comments.
A. Any program, like arogue apparently does, that depends on generating an error for program flow is questionable. I do a fair amount of messing programming and have never had call to do the things D. Kluge likes to see/do. OPEN using 9 or 12. I've never had need to use them. So, I never noticed the SD faults with 9 and 12.

B. Ok, here's one. I wrote a proggy to do crc16 values of file(s). Using SD it was ok. But on using MyDOS, the ACTION! program put a byte in a char variable at the beginning, that SD didn't corrupt that way. I'm not putting down MyDOS, it is the only freeware dbl density DOS for A8 I know of. But as far as having problems with bugs, what I'm saying is, I don't know of any program/DOS/OS that doesn't have a few bugs.
(All I did was make the char variable bigger and MyDOS didn't corrupt the variable, or rather my program didn't crash using MyDOS.)

Cross-posted to: or.forsale,pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

2373. New Atari Web Site!

Hi everyone,

I'd like to announce a new Atari web site. First, let me explain that at the moment, it is primarily a 680xx site, but I _am_ compiling info for use in an 8-bit section, once I take the plunge and go for GeoPlus.

Even so, you might want to take a trip to the "What Ever Happened To..." page, and contribute. This area will deal with all of the figures that have had significance in Atari's history.

I'll also be putting up some 8-bit links soon.

And if you're a programmer, feel free to fill out the "Author's Info Form (please specify which system) - I will not be posting it immediately but I will be doing up the pages in anticipation of getting more storage space.

Terry

"When the game is over, the Kings & the Pawns all go in the same box." -Old Italian Proverb -- Visit The Atari Reference desk! If you have two tins cans & a string, you can reach it!!! Well, not really... but almost :)

>
> (1) what the packet is
> (2) byte 1
> (3) byte 2

You'd have to specify the different packets, and force them to be 3
bytes like you show. For extra integrity, we forced the "Command" byte
to have bit 7 set, and the other bytes not set.

> Oh, and btw, did you ever see, and do you know where I could get a copy of,
> a Battleship game for the GL2? (THat was actually the first place

> difference, btw?)

I don't remember a Battleship game. Chuck S. wrote a Tic-Tac-Toe game
for GameLink I. GLI used joystick ports and polling I believe. It was
much slower, he said.

Source record: 69667

Didn't see original post but see it in your reply so will reply to you
and am sure he will read it
also, I know you know how to work it..

1. The person posting stated he had a 400...(bad news) unless the 400 is
a 48k upgraded
computer..go to BASIC and type in PRINT FRE (0) if it comes up with
less than 39,??? it is
a 16k machine..dos takes up most of your memory..The 1050 disk drive
look in the drive select
hole..if you see anything but Black all the way to the Right looking at
it from the back your drive is not selected as d1:...take a toothpick or
anything small enough to move the double switches to the right so only
the Black portion shows..this is D1:..or D0 as some like to call it.

From basic you have to access the drive with the following..
LOAD "D1:FILENAME.BAS, or FILENAME.EXE, a .BAS file will be loaded into
your ram
and when finished you receive a READY prompt, from there you type in RUN
and enter it
if a basic program and your computer has the memory required left to run
the program should
show up on the screen..

If you wish to run non-basic programs..you need to remove the Basic
Cartridge from the computer and just have the 1050 turned on and then
turn on the computer the disk should load if it is a bootable disk..

Hope this helps..

bob

Someone else likes Smart.Dos???

At the time it was the only dos that you could run batch files by
creating an extender of
FILENAME.AR1, which executed first and Filename.AR2, ect...far ahead of
anything
avaiable at the time.It was produced for the Rana Disk Drive and
distributed with same..
While I even like the Rana for its advanced features, built in
Diagnostics for each mode and to date it is still the only drive
available that will format a disk in any density you wish without being
connected to any computer!!!! No one has touched this feature even in
the IBM eleminent that I am aware of?????

You require a DOS (Disk Operating System) disk. You boot with it in
the drive. This installs the OS hooks that allows other programs to "see"
the disk drive. Otherwise, the system doesn't know it's there.

2384. SpartaDOS X bug:no end-of-file EVER in open-mode 12 (read+write)

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-02 00:00:00 UTC
From: dklugh@iwaynet.net
Message-ID: <60v9aphpg4@triglav.iwaynet.net>
Source record: 69778

Well I've known about this bug in SDX for a long time but I just realized that some poeple may not.

Basicly,a file opened for UPDATE (AUX1=12,read & write) will appear to have no end!
So a programme searching through the file for something will just keep going. Once it passes the EOF the file will just keep getting bigger until it fills the disk.
This happened to me with Atari Rogue.AROGUE keeps all the save games in one file.When you type your name it goes through the file in update mode looking for your entry.Once it finds it it reads in your info and then deletes it so you can't cheat by re-loading after you die or make a mistake.If you're not in save-game file it starts a new game.When you save it will open the file in APPEND (9) to add your save-game.
But,of course the first part never finished with SDX;the file just kept getting bigger.So I edited it so that the programme would do the search in READ (4) mode and if it found the save-game,it would NOTE the possition,re-open in UPDATE,POINT back to where it left off,and go on as the un-edited AROGUE did. (reading and deleteing the save-game record)

As you can see,ICD is just plain insane!

Also,because of the horrid way that POINT was implemented,the AROGUE.SAV file can only be 32k long.Also LOCKING the file doesn't DO anything in respect to AROGUE.It just keeps you from re-naming and deleting the file.You can still save your games.(if you try ERASE or RENAME you get error #170)

Since PCs and Ataris can both use ARCed DCM files that's what I would go for.
Especially since Lynx (doing FTP) and Gopher (FTP gateway) won't download DCM
files.Only ARC files.
(the NEW Lynx (2.7.1) DOES support manualy selecting IMAGE and ASCII mode for
files.But you have to type in the whole path and filename for the file)

2386. Ultima 4 hints (and XL-IT ones too)

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-02 00:00:00 UTC
From: dklugh@iwaynet.net
Message-ID: <60v9blhpg19@triglav.iwaynet.net>
Source record: 69780

Tips for playing Ultima 4:
When the Gyppsy is asking you about what would you do "if?" always choose the Honesty answer.You can tell which is honesty because the Honesty card will be on the left for choice A,and right for choice B.Being "Honest" will make you the Mage so you'll never have Mariah join.I just like being the Mage plus you can steal all you want and don't have to worry about the Mage joining because you're him! You'll be able to buy the best armour and weaponry and you can make up for it later in the game.

Try to put off having any other players join until you have to enter the dungeons.That way random monster attacks will only have 1 or 2 monsters to fight.
(but the monsters in the dungeon "monster rooms" will always be the same number regardless of your party)
Make sure the character you pick can do magic so that you can cure yourself.

When opening a bunch of treasure chests,don't cure yourself right after being poisoned.Chances are that one of the next chests will have a sleep trap
(it's randomly chosen each time,though)
and you'll be cured.That's because you can only have one status at a time and a new status will overwrite the old one.And even if there are no sleep traps, you might get poisoned afgain by the next chest.Better to wait until you've opened them all.This second point also applies to swamp-travel.

If you're playing under XL-IT then turn on artefacting and turn off sound unless you have a really fast computer.(the sound's useless on my 80486-33)
Remember that this game is originaly made for the Apple,hence the artefacting and AM sound.(AM is what some call "digitized sound")
All the Apple had was GR.8 (with 4 artefacting colours instead of 2) and the console speaker.(console speaker is 1-bit on Atari and Apple)

I believe there is a command to make Lynx download any file, regardless
of its 'known' type. Try 'D' on the link (capital D).

> I wonder if anybody came across this problem:
> How to copy disks that have bad sectors?

APE can make images of copy protected disks, which you can then use
on your Atari. However, if you want to make REAL copies that can be
used in a real 1050, you will need alot of expensive hardware.

> Moreover, how to make programs which check for
> their presence work?

There are alot of clever ways. I think some houses like EA, put just
as much work into thier copy protection, as thier games. Duplicating
thier schemes is not easy.

Thats a really huge question, any specifics?

2389. UMich index becoming more usable

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-03 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <611hvk$4qj$1@nuke.csu.net>
Source record: 69673

I've submitted the Atari 8-bit section of the UMich archive to the
"registry" at http://shareware.com/

They require that an FTP archive have at least 25 files, and that it
have a ".QIF" file (which contains each filename followed by its
size, last-modified date, and description)

So, I fired up GCC and created a program called "makeqif" which added
every file in the archive that contains a ".blurb" file into this
QIF file.

Only about 230 files are currently listed, and some of the descriptions
are a bit cumbersome, but it's a start!

I may create a web-based search engine for it and place it on either my
own site or on UMich, if I can find a place to put web files...

If you wish to download the QIF file for some sick reason, it's currently
142Kbytes.

Take care! Hopefully shareware.com will index it soon! :)

While it would be neat to start toying with the 8-bit Atari again,
I already have more than enough hobbies I'm neglecting. I think
I've decided to send my 130XE to a more loving home. The system
consists of :

- 130XE (good)
- JIL JMMR1901 green monochrome monitor 12" (fair)
- 1050 disk drive (excellent)
- XMM801 printer (excellent)
- Wico Command control joystick (good)
- All cables, power supplies, manuals for above
- A few of the Compute! books
- Cartridges :
Microsoft Basic II (incl. manual)
AtariWriter (incl. manual)
The Writer's Tool (incl. manual)
Millipede
Eastern Front

I put 120V to everything and it all seems to work just fine. At
this point, I'm not really interested in selling things piece by
piece. So who wants the whole lot?
(I live in the Toronto area, and to be honest I would
prefer to deal with somebody face to face rather than the
hassle of shipping)

Offers?

>the term preemptive.

Although many pre-emptive multitaskers use time-slicing, the real issue
is whether task switching may occur "anywhere", or only at places the
application has specifically allowed it (note that placing a "yield" call
within all of the program's time-consuming loops may often be sufficient).

Pre-emptive systems may task-switch under any of the following conditions:

[1] The current application has had the CPU for "too long".

[2] An I/O or delay request by a higher-priority task has just been comp-
leted (typically by an interrupt handler).

[3] The current application either deliberately gives up the CPU (a "yield"
or "delay" call) or attempts some I/O that can't be done immediately
(but which will trigger an interrupt when ready).

> In a non-preemptive system (DOS, Win3, Older Macs), each program
>must explicitly hand control back to the OS every so often (by calling a
>system function) so that the cpu can switch to another program. If a
>program fails to do this, it will run forever and no other programs will
>run.

Some non-preemptive operating systems include a "watchdog" function which
can terminate any task that goes for "too long" (settable) without giving
up the CPU; alternatively, some OS's (like Macintosh System 7) allow the
user to terminate a task that seems to be hanging the system ("Not resp-
onding")

> That's the difference between preemptive or non-preemptive; whether
>it's the OS or the program that decides when to relinquish control to
>another program. Generally, preemptive is better, since one program can't
>hog the cpu (note to all you flamers: I said generally, not always.)

Which style of multitasking is better depends upon a number of factors; each style has pros and cons.

Advantages of preemptive multi-tasking:

Slow tasks can't hog the CPU too badly unless given high priority.

Can obtain tolerable performance even with applications whose design is not optimized for multi-tasking.

Interrupt-driven task switching may allow very efficient I/O; rather than having to "busy-wait" for I/O to complete, an application may give up control of the CPU during an I/O request and get it back as soon as the I/O is done.

Advantages of non-preemptive multitasking:

Since task switches only happen at known times, requirements for protecting shared variables are minimal. For example, if two tasks both need to read/write a shared linked-list structure, it's easy to make them work together safely on a non-preemptive system (simply don't offer the OS the chance to switch tasks during an update). By contrast, on a pre-emptive system it's more difficult to perform such operations safely without simply surrounding them by "don't let any task switches occur here" calls (which then creates opportunities for obnoxious tasks to hog the system).

Depending upon system register-saving conventions, the context-switch required for non-preemptive multitasking may be much less expensive than that for preemmptive. For example, if convention (on a 31-reg. system) dictates that registers 1-15 may be freely trashed by subroutines and 16-31 must be preserved, then a non-preemptive task switch only requires saving 16 registers (#16-31). By contrast, a preemptive task switch would require saving all 31.

> Now, multithreading is a finer hair to split. Think of a program
>as the actual code being executed (called a thread) and the chunk of

>multithreaded system, you can have several threads running in the same
>address space; which means that one program can do several things
>simultaneously. Think of it as multitasking for a single program.

Right; if you think of tasks/threads as workers and processes as offices, then OS's can be divided into four logical classifications:

[1] Single-tasking, single-threading
There is only one worker; he can only be in one office at a time.

[2] Single-address-space, multi-threading
There are many workers, all within the same office. While workers can easily share work, they have no protection from each other; if one worker makes a mistake (e.g. putting a document in the 'circular file' rather than the vertical file) it can disrupt everyone's jobs.

[3] Multi-tasking, single-threading
There are many workers, but only one worker can be in any particular
office. It's much harder for an errant worker to disrupt others;
unfortunately, it's difficult for several people to work together on
a job.

[4] Multi-tasking, multi-threading
There are many offices, and workers may be placed into these offices
in whatever way works best. If several workers have to work on the
same job, they may share an office to facilitate interaction. While
an errant worker may disrupt his office-mates, only the job he (and
they) were working on will be affected; other jobs will be unaffected.

Approach [1] is the simplest; number [4] is the most versatile. No's [2]
and [3] both have definite strengths and weaknesses; both of them will
have some severe problems in certain applications.

My preferred system architecture, when doing embedded systems, is to rely
upon cooperative multitasking while using interrupt handlers to manage I/O.
The interrupt handlers do not perform any task switching; they merely
buffer data until the appropriate task comes around to read it. This
approach works well on many CPU's, even those where pre-emptive multitask-
ing would be difficult or impossible (e.g. the PIC series of microcon-
trollers). YMMV of course, but cooperative multitasking should not be
underestimated.

Obviously, the original programmer didn't know how to use update mode
properly. It's fine to open and read/update the data, but close the blasted channel
before you try to do something else. This will close the file and allow for the
next function without this sort of problem. I wrote a rather complex family
history program that used update mode, note and point very heavily. Besides that,
it could read/write/format andupdate the files spanned across multiple floppies. I
never ran into this problem. This was created using a 130XE, XF551, SpartaDOS 3.2d
(first then lated SDX) and BASIC XE.

SpartaDOS uses a much better form of Not and Point which can be used with
the normal BASIC command set. You really only need one value (the offset byte
nymber from the beginning of the file) instead of the two values (sector and byte
in that sector). RTFM for SDCS or SDX in the programming with SpartaDOS section.
It's all there!

> As you can see,ICD is just plain insane!
>

Not at all. I think they did an excellent job. I just wish there was an
updated MSDOS like command set. The SDX cart I have (4.19) plus all the extra comm

programs I've collected aren't as complete. However, some of the SD COMs are better than the MS versions.

Well, of course you'd get that error. It is expecting to find a specific file and if you've erased it, it returns the 170 error. Try copying the data file so you have a backup if you make a mistake or die in that session. Then simply recopy the file to its original name and try again.

Try moving the program to a different DOS formated ATR image. If it's in
AtariDOS 2.5, Try MyDOS or SpartaDOS 3.3. Also try a different emulation mode
800, 800XL or 130XE. Sometimes a different combination of these could make all
the difference.

<manual-motion@worldnet.att.net> wrote:

>Where is the power plug in?

Believe it or not, the power plug for the 5200 was on its RF
modulator, which was also the TV/game switch. Power in and signal
out was caried on a single coax, and when you pressed the 5200's power
button (its only button) the RF modulator automatically switched from
TV to game.

Aesthetically, it was pretty cool. But if you don't have that
critical part, you'll probably have a different opinion.

From: kendrick@zippy.sonoma.edu
Message-ID: <613i9s$6qt$1@nuke.csu.net>
Source record: 69681

I've spent one evening on this new web-based search engine (Lynx compatible,
of course), which is loosely based on the format of Shareware.com
(minus the clutter).

Please come test it out and tell me what you think. Some of the
descriptions are messed up, but that's because the ".blurb" files on
UMich need some work.

It also has a very limited database. About 270 files from UMich.
This because the other 3000 files don't HAVE ".blurb" files or have
misnamed ".blurb" files.

This will be corrected as time goes on.

Also, this search engine isn't going to be limited to UMich! Any other
FTP archive of Atari 8-bit shareware/freeware can add themselves.
See the "Help" page on the site for details!

I recently picked up my first 5200, and having never seen one up close,
was totally confused. Took me at least 15-20 minutes before I clued in
to the RF as being the source for the power. I must've turned the main
unit around and around 50 times trying to find someplace to plug the
adaptor into it. :}

On 1997-10-01 da6rkroom@ix.netcom.com said:
>Will APE/interface cable work with an 800? Also, where can I get
>APE and/or the interface cable?

APE is free from seka.nacs.net in the user directory belonging to "classics".
(hence "~classics")

There is no "APE cable".APE uses the SIO2PC cable.There is a APE-specific cable
called "PRO System" but that's more like the Xformer cable.

The cable should work with ALL Ataris.Perhaps not the 1200XL for power reasons.

>Set your BBS's account to VT only (ie, turn off ANSI) and use either

Actually VT102 and ANSI are pretty much the same thing.
IBM BBSs use the IBM character set,not the ANSI one.So a ANSI(?) terminal would
actually not work that well.And Ice-T doesn't let you change the character set.
(FT-80 does,but only allows 128 characters,obviously)

>FlickerTerm-80 (which flips between two 40-column screens with fonts
>that span only the left, and only the right half of the characters)
>or Ice-T or Ice-T XE (128K RAM required) (which uses a 320x192
>graphics screen and some Display List manipulation to increase the
>vertical scrolling speed probably, oh, 800-fold compared to other
>320x192 text modes).
>Both are excellent programs. Both are available at the UMIch

FT-80 is faster than Ice-T.

>archives:
>http://www.umich.edu/~archive/atari/8bit/Telecomm/Terminals/
>(via FTP access it's ftp.archive.umich.edu then "cd atari/8bit...
>etc." although FTP access is extremely hard to get <:^( )
>Unfortunately, I haven't used EITHER enough to get to know them

>the best Atari modeming I could do was 2400 bps with a P:R:
>Connection. (My 14.4k that I use with my PC refuses to work with
>the PR!)

This is what I was talking about.Ice-T and FT-80 (and BobTerm) don't have
support for buffered modems.You'll have to run Kermit-65 first to un-lock the
modem.You'll have to run K65 after every coldstart.
Oh,once you have loaded kermit you have to use the "connect" command for it to
actually modify the status of the RS232 port.Then OPTION and then "C" to get
back to command mode.

If you ever decide to use K65 for file transfers remember that if you abort the
transfer with BREAK,that it won't close the file until you do another transfer
or quit the programme.(perhaps other commands close the file as well)
So obviously don't take out the download disk until closing the file.
(especially with SpartaDOS,which would wipe out more than 1 sector)

2403. 64 file limit for SpartaDOS?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-03 00:00:00 UTC
From: Graham Thornton <dangermouse@prodigy.nospam.net>
Message-ID: <01bcd00f$5ef2f980$b0f7c9c7@dangermouse>
Source record: 69687

I have created a 720Kb double-density disk image using SIO2PC, and formatted it as an 80-track double-sided double-density disk using the SpartaDOS 3.2G XINIT utility.

However, with over 1000 blocks still free, I am getting error code 169 when attempting to copy new files to the disk. My Atari reference guide says this message means the maximum of 64 files per disk has been reached. Is this true? I am really limited to just 64 files using SpartaDOS 3.2G?

Any suggestions would be appreciated

Thanks in advance.

Graham

(Continuing saga of SD vs MyDOS, etc.)
Ok, I tried my program with DOS 2.0S and DOS 2.5. Only
worked if I specified a full filespec. Now, since my program
doesn't work properly with 2/2.5, I'd say that's pretty
busted, so I plan to fix it. But, Oh, well. I've already
bugged B. Kendrick a bunch with a new version that works
with MyDOS. Maybe he'll read this and not post the new
version.
BUT, the neat thing I did. I ran DOS 2.5, DOS 2.0s, SD 3.2d
and SD X AND NEVER TURNED THE COMPUTER OFF. Ha hahahah.
The A8 is so sweeeeeeeeeeeeeet.

Hi,
Yes, they are probably capitalizing on the new musical group *Atari
Teenage Riot*. Too bad that these dorks chose Atari in their band name,
it's a bunch of idiots screaming over a very noisy sound (I wouldn't
call it music).

Happy Atariing,
Mike "sixosix" Bain

P.S. I have a canon BJC-4100 and I got some transfer paper and printed
out some Atari symbols and made my own Atari t-shirts!!! :o)

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Howdy!

I just programmed on my pc a little tool which converts standard b/w PCXs
into GR.8 ".PIC" files, also a very simple pic viewer in Turbo Basic.

does any one of you need it? It's very amusing to see some new cool hires
b/w graphics...

2413. Fax-Proggie for the XE

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-04 00:00:00 UTC
From: RAUKAMP@dame.de
Message-ID: <36f3df79.fc40.1138@raukamp.dame.de>
Source record: 69697

Hi together,

I just thought about a nice project for a useful programm.
What about using the XE as a very comfotable faxmachine. The speed of the serial interface should be fast enough for a fax.
Maybe this would be a great chance to get a real cheap faxmachine.
What do you think? Is there such a program out there - wpould you use such a program?

From: William Chiuchiolo <ns!chiuchiolo@sprynet.com>
Message-ID: <01bcd10c$edf991e0$3ec1afce@SPRY471431>
Source record: 69698

Does anyone have the driver code/schematic for the IDE interfaced that appeared/was supposed to appear in Atari Classics magazine last year? I am looking for a copy and will pay shipping.

Is anyone interested in building one for me (I have a 130XE) and what would the cost be?

Thanks a lot for the answer. I just want to have a basic system for now
to play around with (and I have way too many computers set-up allready,
like C128, ST, A500, Pentium) so it looks like 800XL is the choice for
now.

(D. Kluge gets, well, a bit blasted by R. S. Ely, and Bob Klass
also likes SmartDOS.)
I agree 100% with Kluge about reading the manual. Why waste
ten minutes reading the manual when you can go straight to
the computer and spend hours trying to figure it out and
then have a neat discussion on csa8? (Actually, I don't
read the manual, didn't read about 9 and 12 in SD books.)
And for Bob Klass. I checked to see if my crc16 (v 2.2)
worked with SmartDOS. Well, it didn't get the same problem
as with MyDOS, and I haven't tracked it down, but it did
have a problem, which leads me to believe it is programmer
error, but my brother is a UA pilot and we don't like
things like 'pilot error' or 'programmer error'.
So, it might be ACTION!, it might be the program, or
the DOS, but I get different results every DOS I try.
Basically the program works(crc16 for A8). For SpartaDOS
you have to give at least one letter of the file you
want to check:

D:C*.*
D1:*.* won't do anything with SmartDOS.
Regards, Russ

> would be GREAT...

The "demo program" is just a cool rainbow fuji that replaces the "memo pad" function in the 400/800 models. I think. Just discovered my 1200XL isn't working. :(

There is no Parallel Bus Interface.

The OS is somewhat different than either the 800/400 OS revs and the XL/XE OS. It lacks PBI support, for one.

It has LEDs on the keyboard that are controlled by some of the bits of the PIA. I forget what info they report.

The keyboard is larger, has a nicer layout and is considered by many to be the best-quality keyboard of all Atari models.

It has an internal power supply like the 800 which takes a 9V AC input. There is supposedly a Bob Woolley mod for removing this and replacing it with an external Atari 520ST floor wart to make room in the case. I've never seen it though.

The SIO has a current-limiting resistor that can prevent devices that draw their power from the SIO from functioning. It can be easily removed though.

The stock monitor output is even worse than the 800XL. Supposedly the video output is actually the best of any atari model IF one performs Ben Poehland's Super Video upgrade (a major overhaul of the video amplifier) because the video amplifier has a three-transistor "saturation boost" circuit.

There are instructions out there by Bob Woolley on adding the XL/XE OS, built-in BASIC, and the PBI to the 1200XL. The final step of adding the PBI looks pretty daunting though. A number of people who are quite good at hardware hacks (Ben Poehland for one, if I recall correctly) have reported trouble getting it to work. The ROM upgrade part looks pretty simple though.

I *think* some of the RAM upgrades for the 800XL can be installed and some can't. Been meaning to find out for sure when I start hacking the 1200XL.

Brent
(who is still trying to find the time to do the Super Video and ROM

> run.

Your assessment is more or less correct, but your examples cause me to cringe. First off, DOS was never multitasking except for the "print" command. One version, DR DOS 7.0, _was_ re-written as a multitasking system, and it was genuinely preemptive. Older Macs were non-preemptive like you say, but so are the latest and greatest (*guffaw*). So why distinguish, when ALL versions of MacOs are purely cooperative in their multitasking. (Aside-Mac8 has a multi-threaded Finder, but the OS provides no support for preemptive multitasking to its client processes, and the software must still be built for the cooperative model.)

Blofeld

Some answers...
There IS an UnZipper for the Atari 8-bitters. It's written by Ivo van Poorten and it's labeld 'version 0.1'...
However, this UnZipper seems to UnZip only the archieves ZIPped in the old 'version-1' format...

Extension-carts for Atari's ? Do you mean such things like the 'Final Cartridge' and so on ?

Well, I know about Monkey-Wrench, a Basic-Extension-cart for the older 400- and 800-computers. But there are many different modified operating-systems available for the XL/XE computers with a lot off extensions. QMeg-O.S. has a handler build in for highspeed-diskdrives such as the Happy, US-Doubler and Speedy. I believe the '97-version also supports the double-sided XF-551 diskdrive.
OmniMon-XE has a lot of features like 80-columns-display etc...
ARGS O.S. has some handlers build in like RS-232 driver, EPROM-disk-handler, RealTime Clock-handler, etc...
Super-Mon has some hacker-utils, like memory-monitor, memory-dump to sectors, etc...
For the people who have a Black-Box (RS-232, Printer and SCSI-interface) there is the Black-Box Enhancer. It has a mem-monitor, disk-formatter, disk-editor for disks and HDD's, and some more features...
It's activating its own menu by pressing a key on the B-Box, and will return to the running program with no problem. It also has a 'dump-screen' button. While pressed it dumps the screen to the printer, just as text, or as graphics on a matrix-printer. It has also an option to use a part of the computer as printer-spooler, or to use the optional spooler-ram that can be mounted at the B-Box itselves...

Some years ago someone in Germany was selling hardware-freezers (Ulf Petersen ?). I don't have one so i can't tell you anything about it, except there where 2 versions, 1 for the 600/800Xl computers, and 1 for the 130XE Atari's...

In Poland I saw some coders who also had a freezer in their Atari's. It has a modified operating-system and some hardware. Don't have one yet...

2432. ANNOUNCE: DirectPad Pro '98 - Use Atari/Jaguar/SNES controllers on the PC

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-05 00:00:00 UTC
From: earle.NOSPAM@geocities.com
Message-ID: <3437343b.0@news2.ibm.net>
Source record: 69716

Do you have a joystick or gamepad that you just love, but isn't available for your PC? Are the awful PC-compatible gamepads making you long for the days of the Atari 2600 and your beloved Wico-stick? Do you miss your "superergo" Jaguar joypad? If so, then DirectPad Pro '98 is for you!

http://www.geocities.com/CapeCanaveral/6552

DirectPad Pro '98 is a combination hardware/software interface that allows Windows 95 to utilize Atari, Jaguar, and SNES console joysticks and keypads on PCs. All of the interfaces require minimal wiring and operate through a free parallel port. Any Windows DirectX compatible game can use these interfaces automatically!

Currently, only digital devices are supported. Analog controllers, like paddles and the non-digital joysticks are not supported by this interface, and should not be tried. Additional console controllers will be supported on a request, time, and information available basis.

And of course, DirectPad is free software! :)

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection.

Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*. If there is no copyright notice, software must be considered Freeware rather than in the Public Domain.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)
- Classic Computing, published by the Historical Computer Society

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

[Article crossposted from sk.forsale]
[Author was Neale Partington]
[Posted on Tue, 23 Sep 1997 23:13:10 -0600]

Looks like my earlier message vaporized after just two days, so here goes again! Everything in top working order unless noted otherwise:

Commodore PC10-III, 640k ram, 20MegHD, Packard Bell monochrome (yellow) screen, 10Mhz clock, 3.5, 5.25 floppies, 101 keybd, switching power supply, CGA/MDA/Hercules/Plantronics video. $35

Star SG10 9pin with NLQ, Star, IBM modes, 120cps, 240dpi (better than many 25 pin printers!) $40 uses non-proprietary spool ribbons.

CITOH F10-40 Daisy wheel (for true letter quality), with 12 print wheels, $30.

CITOH A10-30 Daisy wheel e/w tractor feed, excellent for labels, has 16 wheels, $30. Tractor feed is easily removed/replaced.

ATARI 65XE plus two joysticks, 2 X 1050 disk drives, Missile Command game cartridge, lots of software. Make me an offer.

ATARI 800, expanded to 256k memory, (memory expansion needs tweaking). Make me an offer.

I'm in Regina. Call me at 586-4867 (home) or email me as neale@ieee.engg.uregina.ca.

: It's kinda addicting, I'll sit down and easily play it for a half an
: hour at a time. The problem is the wall that I hit at level 15. I can't
: get by it!!! Anyway, my high score is 56220.

Heh heh heh. Pretty annoying, huh? :) Level 15's actually pretty
darned easy, compared to level 20. (Well, duh. Of course it would be. :))

Just imagine level 15 starting out completely full and going faster. :)

I CAN actually beat level 20 myself. I was a jerk though. I didn't
add any cool ending stuff. You just play level 20 ad infinitum at that
point. :)

> 1200XL isn't working. :(

Got it working and discovered my memory is faulty---it's a rainbow
Atari logo all right, but it's just the word "ATARI", not a fuji. It
does not have the self-test feature. Personally, I think this is
cooler and will miss it when I upgrade.

Another difference/difficulty: the cartridge port and joystick ports
are on the left side of the machine in a cool-looking layout which can
make it impossible to plug some joystick connectors and cartridges in.

>Keyboard layout? Hm, I'm partial to the layout as the PC has it
>because I'm used to it now. (It's also much more standard.) I like

huh? The PC is the only computer I used with that kind of keyboard.
Most have the 2/" and 7/' combinations.

>the idea of two default switchable layouts to support diehards.
>What about a user customizable layout? Don't some of the PC
>keyboards have that?

Remember that the XL/XEs have a user-definable key-map.

>Wouldn't it be nice if somebody who has the ability to screen-print
>on keys is interested in helping on this project? Then you could
>get them with the appropriate graphics instead of the PC standards!

Actually printers have their own character set since they aren't tied to any
one computer.Some (at least mine) also have the IBM character set.

You might look into a monitor to let you save screen memory and the G: handler
to print out in ATASCII.

Hi All,

This is the first email to announce the start of a new international multiplatform 'commercial' project 'Codename G-OS'.

Most of you are not currently on the official mailing list and those who are not will not get any more emails than this first one unless you contact me and tell me that you would like to be on the list.

If you are a developer and are interested in being part of this project, please email me.

Disclaimer
==========

Nothing here is yet solid, but are ideas that will evolve with the project.

Codename G-OS
=============

Codename G-OS stands for Generic Operating System. It is the bringing together of many old and some new OS concepts in order to create a functional operating system for many typically incompatible computer systems. G-OS will be CPU independant, but give most of the full speed of each CPU - read on...

Codename G-OS target platforms
==============================

Initially G-OS will be targetted at computers that are currently considered redundant, or no longer manufactured. This will hopefully increase the userbase of G-OS to a reasonable size before targetting current more modern platforms. It will also encourage new comers to software development who both enjoy programming these old systems or wish to widen their audience for new computer applications.

Initial target systems will be (not in any preferred order, but in order of programmer resources - this is where programmers are needed):

Platform CPU

Amstrad CPC Z80
Amstrad PCW Z80
Commodore 64/128 6502
CP/M based 8080/Z80
MSX based Z80
ZX Spectrum Z80

MSX (various) Z80

Later targets:

Amiga 680x0
IBM Compatible 80x86

Yes, G-OS will be Commercial/Disclaimer (only an idea at this stage)
==========

G-OS will be a commercial product. All people/companies (copyright holders) involved in its development will have the SAME EQUAL rights to the full G-OS source code AND runtime.

Each copyright holder will be allowed to do ANYTHING they wish with the product with the exception of a few points below. They can give away, market or sell the G-OS source code/runtime at their own will. This will create competition and increase distribution channels.

None of the developers/copyright holders one will ever be responsible or liable for any damages directly or indirectly due to the use or mis-use of this product - if sold, a disclaimer will be created to protect all involved.

No one will be allowed to further develop and 'release' this OS in a way that will render some platforms incompatible unless the platform becomes non-supported because of lack of programming resources (ie: no access to an MSX programmer or computer will not prevent all other platforms from progressing). This will be considered a breach of contract liable to legal action. This will also control the compatibility between platforms and ensure that a standard IS followed.

A board of developers will be created to make decisions - mostly they can be debated (hopefully quickly) and a majority rule situation will apply - but... The overall concept of the OS, being platform independant cannot be debated.

Features
========

An initial feature list at this stage would be impossible to be fully accurate, but here are some ideas for possible and desireable features of G-OS.

CPU independance (P-Code software with JIT (Just In Time) Compiler)
Multitasking AND Singletasking (depends on available RAM/resources etc)
GUI
Commandline
Shared libraries/device drivers
JIT compiler embedded in the OS

The feature list will no doubt grow.

Implementation
==========

Because G-OS will be multiplatform or 'platform independant', there are some key factors that will make G-OS unique in both the way it will function and they way it will be implemented.

G-OS will have a HAL (Hardware abstraction layer) which will lie beneath (or in the middle) the OS. G-OS will be mostly coded in a generic P-Code that can be compiled to native code by the JIT compiler which will be an optional part of the HAL. Platforms which support the JIT compiler will benefit from huge speed improvements. The JIT compiler itself will be written partly in P-Code with ONLY the platform specific code generation routines written for each platform. This will make one compiler available to all supported platforms. Libraries and devices can be written in P-Code as can applications. The JIT compilier will have the option to compile to native code 'ONCE ONLY' or 'ON EVERY LOAD' of an application/library/device.

About Me
========

My name is Julian Cassin, I live in Melbourne Australia and am director of a small computer company 'Computer Kingdom'. This project will be a commercial venture for 'Computer Kingdom' but initially a non profit one. ALL parties involved will benefit EQUALLY from - whether they are an individual OR a company. The more resources that can be put into this project, the better the outcome will be.

If you like the idea of this project or have any constructive comments about it, please contact me - I would love to here from you.

Regards

Julian Cassin
(Director - Computer Kingdom Pty Ltd)

2452. FS/T: Atari 8-bit computer items [10/06/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-06 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <343afdc2.5326022@nntp.ix.netcom.com>
Source record: 69588

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 10/04/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 5.00 Home Filing Manager, The (Atari)
$ 5.00 Print Shop, The (Br0derbund) {3}
$ 5.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 5.00 Timewise (Atari) {1}
$ 5.00 Touchdown Football (Electronic Arts) {2}
$ 5.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$10.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 9.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$10.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$14.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 8.00

*****

LOT #2

ATARI 1010 PROGRAM RECORDER, with power supply, and manual.

This item has not been tested.

I have plugged in this recorder, and it did power up. The
rewind and fast forward (advance) functions work. It must be

hooked to a computer to test the play and record functions.

$10.00

*****

LOT #3

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #4

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$25.00

*****

LOT #5

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #6

EPSON RX-80 PRINTER with built-in power cord.

$15.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first
disk-based software item and $1.25 for each additional disk-based

software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,

4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

This list was last updated on 10/04/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 233 for various 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site,
including 12 for the Commodore Vic-20 computer!

I have the following printers available, for sale or trade. These
were acquired with various computer systems, and while they may work
with more than one type of computer system, I have included the
type of system that they were acquired with, where applicable.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

HARDWARE:

NOTE: The Lots listed below include only what is listed!

Accessories:
$ 6.00 Star SG-10/15 Dot Matrix Printer Users Manual

****

APPLE][COMPUTER:

LOT #1

APPLE IMAGEWRITER II PRINTER with power cord.

$49.00

*****

LOT #2

APPLE IMAGEWRITER PRINTER with power cord.

$24.00

*****

LOT #3

STAR GEMINI 10-X PRINTER, with built-in power cord, and Users Manual
(266 pages). Can be used with the following computers: Apple][,
Atari 8-bit, Commodore 8-bit, IBM PC, Osborne, and TRS-80.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$45.00

****

ATARI 8-BIT COMPUTER:

LOT #1

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$25.00

*****

LOT #3

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #4

EPSON RX-80 PRINTER with built-in power cord.

$15.00

****

COMMODORE 64 COMPUTER:

LOT #1

RITEMAN LQ [model LTR-1] TERMINAL PRINTER (InfoRunner / Japan Electronics Ind., Inc.), with manual and built-in power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 7.00

*****

LOT #2

COMMODORE MPS801 DOT MATRIX PRINTER, with built-in power cord.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address (this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

2457. 130 XE: Power supply pin out?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-06 00:00:00 UTC
From: John McGowan <jmcgowan@shell.inch.com>
Message-ID: <61av12$5pv$1@news.inch.com>
Source record: 69593

What is the power supply on the 130XE? 5V DC, 5.5V DC, 6V DC? Or, like the 800, is it AC?

and what are the connections on the power supply's pin (say, looking into the connector on the line)?

[I had given my sister my Rambo'ed 800XL, for which I had built a power supply, since, after getting the Rambo, my power supply which had worked for two years, burned out in the next two weeks as did a replacement I got -- so I used the article from Analog on a UPS and simply ignored the battery backup... a simple transformer, full wave rectifier, filter (simple capacitative shunt) and voltage regulator (with heat sink). That power supply is still going strong... now I guess I will have to build another for this 130XE I got at a yard sale for $5 along with a plain (unDOUBLed) 1050 drive.]

Unfortunately, my sister has my Indus GT and 810 drives; my Sparta Disks; MyDos Disks; full set of Antic disks; game disks (ah... BoulderDash!!!); Mac65 cartridge and manual; AMAC (Atari Macro assembler) DOS 2.0 disk; TextPro (with my *good* MailMerge Macro and math macro); my old StarNX10 printer (and PrintShop, PrintPower and DaisyDotIII along with my programme to convert PS icons to characters in a DDIII font); my page layout programme (up to 8 graphics 8 or *.MICropainter screens on a page... use any sort of thing to create them, say GraphicsMaster or Rambrandt and a short Basic programme I wrote to convert 40 col. Gr. 0 screens to Gr. 8 allowing font changes... lay 'em out and you have a newsletter programme... I found it nicer than things line NewsRoom and other proprietary such programmes which needed their own graphics formats since they used 60 dots per inch horizontal (the default on 9 pin graphics printers) which did not allow for two Gr. 8 screens across a page (which would require 2*320=640 dots or 80 dots per inch) -- but one can force most 9 pin graphics printers to do 80 dots per inch (the StarNX10 had such a mode, and many have quadruple density at 240 dots per inch... so just print every third dot in quadruple density... as my page layout print manager did)).

She also has my P:R:Connection, so I don't even have a serial port on this thing for null-modeming data to it (not to mention not having my BobTerm disk).

This $5 computer came with the 1050 drive (with power supply and SIO cable) and -- DOS 3.0 with manual!!! (from the manual, it doesn't appear to be that bad... just not DOS 2.x compatible... nor MyDos nor Sparta compatible either, of course). I guess I will be stuck with that until I can get her so send me some of my MyDos and Sparta disks (but,

while the DOS 3 disk supports conversions from DOS 2.0 to DOS 3, how will I convert any files I now work on using a DOS 3 disk to DOS 2.0, MyDos or SpartaDOS disks?).

I'll have to get her to send me some of my disks (including BobTerm and game disks), MAC65 (and manual) (she can keep the Editor/Assembler cartridge and manual) and the P:R:Connection (and my Modem cable, or else I will have to switch the three wires on a standard IBM 9 pin modem cable which are different from the Atari -- but which three wires *were* they?) (so I can null modem stuff I can find on the InterNet) -- I just hope I can still find some good (NOT Tandy/RadioShack) double density disks (and she also has my Disk Notcher to use the back sides, but I have a paper punch around here somewhere).

Now where can I find a 9 pin digital joystick? Oh well, I gave her about five of them (including an Atari trackball), so she can send two of them as well (I guess) [or is a Nintendo controller digital -- i.e. just switches... and does anyone know the pin connections on the 9 pin port... she also has my copies of "Mapping the Atari" -- or maybe I can find at RadioShack one of those Coleco joystick/numeric keypads they had for awhile, but those too require some remapping... but the keypad was cute... you could remap it to include the effect of tripping both the UP and DOWN switches on a joystick! besides the more normal effects (say, the UP and RIGHT switches which were tripped for upper-right diagonal movement -- now *how* did I rewire that? I believe just the ground wire, but I forget...)].

Ah well... back in the Atari fold...

2460. New name for CTH

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-06 00:00:00 UTC
From: "Tom Hunt Sr." <tomhunt@bright.net>
Message-ID: <61bjre$5ti@cletus.bright.net>
Source record: 69596

After having a bit of trouble over the weekend with the NIC server that I normally use, I've decided to try out another service. So at least temporarly, CTH will use the following names:

http://www.cth.dynip.com/index.html
ftp://ftp.cth.dynip.com/ftp/ (for most web browsers)
ftp.cth.dynip.com (for most ftp clients)

The previous name service provider claims that they will fix their NIC server "real soon now", so the old name may start working at any time. But in the mean time, at least temporarily, you can get to the CTH servers at the above URL's.

I'm sorry for any inconvenience and confusion this may have caused. Also, some web pages may not work correctly, until I've had a chance to do some editing.
- Tom

Yeah!!! But you want us to pay you for Rainbow when XL-it already does it
and it's free!!!!!

Sorry! Had to spout off there. Having been burnt by purchasing Xformer and
getting a half-ass product from the company, I'm really getting disgusted
with everyone wanting to make a quick buck off emulators.
(This also includes other emulators...SNES,NES,C64, 2600,etc.)

Here's my philosophy......I WILL buy an emulator if it performs better than
what's freely available. But I am NOT going to pay you $35+ for an emulator
that's inferior to a free one.

So if you want me to buy Rainbow, make it a HELL of a lot better than XL-it
or WinAtari(which is better than Rainbow, in my opinion...and it's free.)

>Rick D.

It's still in production from the Western Design Center, at

http://www.wdesignc.com

For an Atari version, there were 2 that I know of: DataQue's Turbo '816
(isn't Terry Ortman trying to sell one? heh heh) and Fine Tooned
Engineering's Sweet 16. I don't believe either is now available, though B&C
was listing the FTe mod a year or so ago. I have one; it works fine in
either mode, but no '816 soft besides John Harris' assembler was ever
released. The FTe mod never even had expanded memory released.

Hope this helps,

Look for ATZMODEM, at Umich I beleive. It's a d/l only Zmodem implementation for the 8-bit, and runs quite well. When I had a university shell account, I used FlickerTerm for the 80 column work, then "Z.COM" from a RAMdisk for downloads.

I still haven't seen a ZModem upload for the 8-bit, though.

Howdy Bob

Did you get my Intern. Postal Money
Order?

When is the next issue due? I can
barely wait to get my fingers on it.
The 16MB upgrade and the 80 Column
Upgrade sound nice. Are you gonna
use the YAMAHA chips (like the SEGA
has) for the 80 column upgrade?

I told the guys and girls on IAN and
USF about your projected hardware
articles and they loved it.
Especially Ryan Goolevitch and Erhard
Puetz, they wanted addresses and
prices.

These upgrades are gonna work with
the standard OS or the US+ OS (by
CSS)? And the BlackBox?

CU Mathy Van Nisselroy

Howdy folks

A question for you guys (and gals)
who know there monitor electronics:

My Philips CM8833 monitor (which
probably has a brother called
MagnaVox and maybe even Commodore
xxxx) has this funny twitch
sometimes. For a very very short
time (maybe a second???) the screen
gets a wee bit narrower and a wee bit
higher, then it pops back to it's
normal shape. Is this announcing big
troubles or just tiny ones? Please
tell me soon since the 1084 standing
here has two jacks for sound but only
one speaker (left one). I guess it's
easy to upgrade it to stereo, but I'm
kinda allergic to those 25 KILOVOLTS
that might be stored inthere
somewhere.

CU Mathy Van Nisselroy

(PS I don't know if I even have an
E-mail address, since I'm posting via
Thunderdome BBS which get's it's
InterNet/UseNet stuff via Stack BBS)

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

2470. Austin 80

Howdy folks

DARK4ROOM@IX.NETCOM.COM said:

"I used to have a company that
manufactured/designed ... an 80
column board for the ... Atari 800
computers. ... It had to exist in a
bank switch cartridge, in the right
slot, and take up only 256 bytes of
space per bank...and run fast
enough!"

Could it be converted for "left slot"
use? I'd love to have 80 columns on
my computer, but I'm an XE-lover.
And the XEP-80 isn't really a nice
piece of hardware. And with BobTerm
it'll only go up to 9600 baud (Erhard
Puetz modified Bob Puff's XEP80.BTM).
How fast is the Austin 80? How hard
would it be to built? (I did get
that right that you are releasing
these plans/schematics) And how
expensive? Does the Austin 80 need
special drivers? Oops, almost
forgot, is it b/w or color?

To everybody else who reads this:

How is this Austin 80?
First Analog Computing I ever bought
was issue 45 (one day I'll find/buy
those other issues here in Europe and
find out what that robot thingie was
they talked about in issue 45), so I
never read anything about a test. It
was a nice magazine with nice ads,
untill somebody toke it over ...
<SIGH>

If it could be converted to "left
slot duty";

- would it be PBI (read BlackBox)
compatible?,

- could it be used with other
cartridges (either as a passthrough -
e.g. SDX, RTC8, MUX - or with
multiple cartrdige slots).

BTW how is it connected to the

Yeah!!! But you want us to pay you for Rainbow when XL-it already does it
and it's free!!!!!

Sorry! Had to spout off there. Having been burnt by purchasing Xformer and
getting a half-ass product from the company, I'm really getting disgusted
with everyone wanting to make a quick buck off emulators.
(This also includes other emulators...SNES,NES,C64, 2600,etc.)

Here's my philosophy......I WILL buy an emulator if it performs better than
what's freely available. But I am NOT going to pay you $35+ for an emulator
that's inferior to a free one.

So if you want me to buy Rainbow, make it a HELL of a lot better than XL-it
or WinAtari(which is better than Rainbow, in my opinion...and it's free.)

Try http://www.wdc.com, they have high speed versions of the 6502, 65816
and PIC-like versions of both, w/ RAM/ROM and I/O ports.

2474. New user needs HELP

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-06 00:00:00 UTC
From: unclebigbad@hotmail.com
Message-ID: <343968b3.3211951@news.icongrp.com>
Source record: 69610

A few days ago I was going through a Thrift Store and found an Atari 130-XE along with a 1050 disk drive, all cables (never even unwound) vinyl covers ect. for $10.00. Dont think its ever been used. I passed on it at first and then went back the next day and picked it up.

I know nothing at all about Atari Computers, back in the 80's I was a TRS-80 Model III kid :) Also about a year ago I picked up a 600XL for cart games, thats about it.

My main question is, how do I get programs off the net and into the Atari?
I dont even have a DOS disk for this thing, is it possible to make a bootable dos disk on my PC? Maybe by using Spartados and MyUtil?
Or do I need one of those special cables and APE software?
How about a null modem hookup? I'm assuming the port on the Atari is not a standard serial port and I need something else hooked up to it first. What would such a device cost and where could I get one?

If I need a DOS disk, can someone please send me one, I'll of course pay for shipping along with a few bucks.

Thats about it for now, I just want to get this thing up and running.

One more thing, this Thrift Shop had another 130XE still in the box for $8.00 along with another 1050 in the box for $4.00. Are there any programs that would make use out of having a second 1050 or would I just be wasting money?

Thanks,

George Torch

I personally studied this possibility years ago (and had to stop rumors
that I was working on it). I collected a fair amount of documentation
on the subject, if anyone is interested in pursuing it. The nasty bit
is the decoding/encoding of the bilevel data for the CCITT standard
transmission. But it can be done.

>huh? The PC is the only computer I used with that kind of keyboard.
>Most have the 2/" and 7/' combinations.

Huh? I just walked around the office and looked at the keyboards on
different systems:

The Suns, the HP 9000, the PCs from Digital, ALR, and a bunch of
no-names, the Wyse 60 terminals, the UBI data entry terminal, the
Telxon handheld RF barcode scanner, and (finally) my Amiga (no Macs
here) all use a 2/@ and 7/& keyboard.

The only keyboard with 2/" and 7/' I could find was on my Atari 400 in
the 'arcade' room here.

I think a DEC terminal I used in college in the mid-80s used a layout
similar to the Atari's (or more likely the Atari 800 adopted its
layout, since the keyboards looked and felt identical down to the
speaker click.)

Bill,
You wrote asking for a copy of Battleship for Gamelink. Yes, its for Gamelink I(GL1). I know, because I'm the one that comverted it over from the modem version. GL1 uses joystick port 2 between two computers. I also had plans to conver modem chess over, but after looking at that program, found it was a nightmare, and would need a lot of work. I was also going to make Hangman and ESP. Too little interest and too many other things to do.

As for setting up the Gamelink 2 system. Jeff Potter and I took slightly different paths in coming up with a multiplayer board. Mine would allow 6 A8s to be connected. I only had four I could setup, and they worked! But, as {I worked on the board, I realized that the worst thing to happen was a player {would need to go home, and that would be the owner. So, I did a little {thinking, and finally decided the best thing was single player kits. So I now have two items, the GL2 adapter and the GL2 BOOT adapter. Both need regular audio cables, and "Y"s to make a complet loop. The Boot adapter is a complete SIO cable with the GL2 adapter in the middle and a switch so that after the main system loads the program, it could be switched to the GL2 net to let others boot, without having to unplug stuff. These have been tested with 20' audio cables.

I think, there are at least two more ...

I don't know, if Ingo Maindorfer in Germany finishaed his project, but there's another project, too (Sorry - I've forgotten the name of the developer.) There are parts of the scemes and a description on Mareks page in Stuttgart (yes, the page with all the wonderful links on it ...)

I've seen a board once and can tell you - really fast.

Maybe there's such an development in poland too, cause dracos SI recognizes the 816 ...

Matt

P.S. BTW - the original poster wannted to know, where to get the bare CPU ...

Daniel Woodard wrote:
> Isn't the C64 modem just 300 baud? How can it handle faxes at
> such a slow speed?
>
The c64 through its userport used to handle 300 baud (the infamous VICModem), later 1200 baud, and third parties, 2400 baud. But that was ten years ago.

This is the 90's. :) The c64 is capable of handling 230.4KBps... The only problem is that software has not yet been written to take advantage of the increased capacity that the cartridge port offers with beefed up RS-232 hardware. As far as I know, 28.8 is the software limit now.

As for the fax program for the c64/128, while I have not studied how the program conduct fax transmissions and reception, I can gather that the program relies on the modem's hardware for fax processing. This relieves the burden of data processing via fax on the poor ol' 1MHz 6510 chip. :)

The point is that it can be done for the Atari- A program could also rely on the RS-232 hardware and modem hardware to do the grunt work of fax processing. All the program has to do is to store the contents somewhere for later viewing/printing/disposition, etc.

Hi All on the Codename G-OS mailing list.

Thanks
======

Firstly I would like to thank all who responded to the original email and newspostings, the responses have been both positive and in great number. In addition to that many people made positive suggestions regarding the project.

Codename G-OS needs a Name
==========================

Codename G-OS needs a name, I had one email stating how similar the name 'Codename G-OS' was to 'GEOS' on the Commodore 64. Although for several reasons, I would like to disagree (ie: our name has 4 sillables, GEOS has 2) I think a better name could be given, perhaps GENOS? Then an Integrated Development Environment could be called GENOSIDE :)

A couple of people also made me aware of their concern regarding the slowness of a JIT compiler on an 8 bit computer. Firstly, the JIT compiler would NOT be JAVA based, but could have some parallels - ie: being JIT. Also, it is likely that the system would be created around a Virtual Machine with a Virtual Machine Language (VML) that would be designed specifically to execute reasonably fast on an 8 bit computer if interpreted and maximum speed when compiled. Even interpreted BASIC is reasonable on some systems and when compiled, very quick. One great idea from one of you who emailed me was to have the compilation part of application installation so most users wouldn't even be aware it was happening - personally I like the idea.

Programmers needed
==================

Programmers are needed for a project of this scope. At this stage, a list of possible developers is being created.

It currently looks like this:

Wen Carkner 6502/Commodore 64
Luke Adams 6502/BBC Model B

Other non-programmers
=====================

Although many people would consider themselves non-programmers, they are not at all useless for this project - Other useful things people can do are supply IDEAS, BETA-TESTING etc...

To be or Not to be - Commercial that is
=======================================

The 'commercial' concept I outlined previously had a few critisms. This is good to have feedback, but here is the reasoning behind the suggestion of being commercial.

To be commercial has the following benefits:

- The product will controlled centrally (in concept) by a SINGLE development group.
- Full legal control over other commercial product spinoffs.
- Full legal control over incompatible spinoff versions.
- The product will be supported by both individuals AND commercial organisations.
- An Individual developer will have EXACTLY EQUAL rights as all others including
organisations.
- It seems that commercial has better reputations over freeware and shareware as far
as Enterprises are concerned. Who runs companies of a Public Domain OS?
- ALL source code will be delivered WITH the OS so every man and his dog can customise it. Do you like the way the OS looks? Everyone has their own opinions. The public can suggest better code to the developers.
- We can promote the OS in the same way as other organisations. ie: Advertising?

Of course this means a contract should be written out sometime that EVERY developer gets - the same EQUAL contract for everyone.

The only downside is the Fred cannot legally give Barney a copy, but Barney can himself get a FREE copy from somewhere (ie: the web, email, snailmail).

Development Coordination
========================

To coordinate the development of this project, because it is both international AND multiplatform, several resources will be necessary.

WWW - This will be used for general/technical/progress information and advertising.
- Also ALL current source code/related utilities will be available from here.
EMAIL - More up to date communication amongst developers.
FAX - People can FAX information to anyone with a FAX machine.
NEWS - General updates for everyone, and to attract newcomers.

Where will we start?
====================

Well, we are starting now...

1. Initially, a plan will be drawn up - anyone interested in playing a role in the
project should email me and let me know what they can do for the project.

2. All developers will be asked to communicate and come to agreement on what the OS will
do, how we will implement it etc...

3. Design phase.

4. Implementation phase.

5. Testing phase.

Of course this is a very basic outline at this stage, but it will surely progress.

Regards

Julian Cassin

>

Back in the '80's there was a system named the p-system. It ran on z80, 6502, dec vax, ibm pc, SCO IV, and a bunch of others. It uses UCSD Pascal. The concept was to create an operating system that used a virtual machine. This virtual machine had it's own virtual cpu, virtual assembly code, virtual devices. I'm surprised more people haven't heard about it. I've worked with the p-system for about a year now on a z80 and SCO IV. The same code that runs on the z80 will run on the SCO IV system. Pretty cool. Below is an excerpt I ran across while surfing the web: http://www.threedee.com/terak/ucsd.html

---

What is the UCSD P-System?

It is a portable operating system that was popular in the early days of personal computers, in the late 1970s and early 1980s.
Like today's Java, it was based on a "virtual machine" with a standard set of low-level, machine-language-like "p-code" instructions that were emulated on different hardware, including the 6502, the Z-80, and the PDP-11. In this way, a Pascal compiler that emitted p-code executables could produce a program that could be run under the P-System on an Apple II, a Xerox 820, or a DEC PDP-11.

I would also like to point out that there is another "virtual machine" system already available for most types of personal and home computers. It is the z-machine that Infocom created. I have used the Inform 5.5 compiler and an atari 8-bit version 3 interpreter to create the Infocom-style games found at: ftp://cth.dynip.com/ftp/pub/Atari_8bit/More_Atari8bit/CTH_SHAREWARE/TGAMES.ARC . These particular games will boot the atari 8-bit version 3 interpreter. But the actual (z-code) games will run on ANY machine that has a version 3 interpreter! Pretty nifty.

Julianne,

Your best solution will be to call Best Electronics at 408-243-6950
and order an Atari
1200XL name plate, remove the 2, buy a black rub-on lettering kit from a
hobby shop and apply the 4 in the 2's place.

Hi Sam,

Well as for your questions:

Yes, the disk must be in the drive, the drive # must be 1 and the drive needs to be turned on prior to inserting the disk. Then turn on your computer, then drive will begin to load DOS 2.0

As for BOBterm, if it is on a DOS 2.0 disk with DOS 2.0 installed then yes, it will boot up, you'll need the AUTORUN.SYS file with the drivers for the appropriate interface/modem you are using. Then you can run BOBterm.

Some programs may want to see XL or XE ROM OS chips, but most should run fine.

Since your only using 32K stick with DOS 2.0 or even MyDOS 4.5

As for 80 column cards, there were 2 made for the Atari 800: The Bit-80 and the Austin-Franklin 80 (Actually had RGB color output with text attributes, quit nice). Both needed to be installed into SLOT #3 in the Atari 800 so they would not work on the Atari 400. However you can purchase an Atari XEP80 interface module which is an 80 column box with a standard parallel printer interface. You may want to consider upgrading your memory however. B&C Atari Sales & Service at www.myatari.com has original Atari 48K OEM memory upgrades still in the box and they also sell Atari XEP80 interface modules. Upgrade to 48K, get an XEP80 and then buy a copy of AtariWriter 80 which works with the XEP80 module for 80 column wordprocessing. If you REALLY want to get fancy think about finding a copy of SpartaDOS and the XEP80 drivers and you can use that to run the 80 column interface. With all this upgrading perhaps you should consider getting an Atari 800 if you like the original series computers or think about stepping up to an 800XL or 130XE.

Curt

>preemptive means.

There's a pretty good answer to this posted; perhaps an even simpler distinction is that a preemptive system has some sort of "executive" who can interrupt any user-level process at will - sort of a time server to which all the other processes are clients. A cooperative system has no such executive - all the processes are peers, and theoretically equals. An executive has the advantage of being able to enforce different levels of priority for the "client" processes; a cooperative system has the advantage that a process can (temporarily, we hope) elect not to cede to anyone else and thus run in real time when necessary. There are pros and cons to either approach, but cooperative multitasking places more responsibility on programmers who develop user-level software (I don't have to think about scheduling at all when I write a Unix application), making development for a cooperative system more difficult.

So preemptive multitasking handles scheduling outside of each process (with some meta-process, typically in the kernel) while cooperative does scheduling inside each process.

Although I'm sure you'll get many replies offering you good deals, you can still buy through dealers. Yes, some are amazed that there is enough interest in the old Ataris to still support retailers, but there are vendors out there that still sell even new equipment. For a good example of what's available, look at www.myatari.com on the web. B&C Computervisions has been in business for years as an Atari only retailer. Though some say their prices are high, their selection is fantastic, so you don't have to spend a long time looking for what you want. If your time is money and you want it quick, B&C can often get you what you want quickly.
I know this sounds like a commercial, but I never see anything posted in this newsgroup from Bruce and Cathy (B&C), so I'll post this for them.

> preemptive means.

Let's say that there is a business that has only one computer, and there are 10 people (programs) wanting to use it. One way to let everybody use it would be to have them cooperate, one person finshes what they are doing, and then another uses it, when they finish, they let another person use it, etc.... Another way would be to have a time chart, and have it enforced by fireing people who try to stay on. Person one has a fixed period of time, and then they get kicked off by the boss (Preemptive OS), who lets person two use it, then person three, and so on.

I hope this analogy helps you understand.

2515. Codename GENOS (was Codename G-OS) Mail 3

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-08 00:00:00 UTC
From: Lazy Bone <zhulien@alphalink.com.au>
Message-ID: <343BE1D1.MD-0.198.zhulien@alphalink.com.au>
Source record: 69549
Cross-posted to: alt.c64,comp.sys.amiga.emulations,comp.sys.amiga.programmer,comp.sys.amstrad.8bit,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.m6809,comp.sys.msx,comp.sys.oric,comp.sys.sinclair,comp.sys.tandy

Hi everyone.

G-OS now GENOS
==============

I mentioned in the previous mail that someone pointed out the similarity between the name 'Codename G-OS' and the product 'GEOS'. Because no similarity was intended, the name for or generic OS, will be now called 'Codename GENOS' until a better name can be found. If you have a suggestion, let us all know.

MAILING List and Feedback
=========================

Most email software when replying to emails has the facility to 'reply to all recipients' - that means if you receive this from me (which was sent to approx 10 people), you can also email them all and share your ideas with everyone. This should work well. I will send updated mailing lists as I think worthwhile.

VML (Virtual Machine Language)
==============================

Several people mailed me their concern regarding the speed that a PCode system would be like on an 8 bit CPU. Here is the now intended solution for Codename GENOS.

Codename GENOS and it's Applications will be written in VML. The development of this VML has just started and will be based around common instruction types that are commonly shared by CPUs. It is hoped that most common instructions will have a one to one relation with the native target CPU's machine language. Of course there will be some instructions that will infact have to be coded as a 'routine' on the target computer. I currently believe this will give an almost full performance on EVERY target platform.

As mentioned before, I had a suggestion from one of you that during the installation of an application should be when the JIT is invoked. This is way it will probably be. Why translate the code from VML to native code EVERY time an application is run? The users wouldn't even be aware there was a VML behind the scenes. We will achieve full speed and full portability - no 'runtime' code will be interpreted.

HAL (Hardware Abstraction Layer)
================================

The HAL is a very important portion of this OS. The OS could exist with no HAL, but it wouldn't be able to handle input/output and still be portable if the HAL wasn't there.

The OS needs input/output so, the HAL will contain a set of standard documented routines which MUST be implemented on EACH target platform.

The HAL's implementation will start of simple, with text output, command line input and some sort of secondary storage support. From here, it will progress to bitmapped graphics (for systems that support this), communications etc...

Remember, not all computers have human input devices, the target system could be an embedded system, or PLC (programmable logic controller).

Intended Applicaton Development Process
=======================================

Initially development of applications will have to be done in one of two ways. Either with a hex editor (to created VML software), or with the assistance of utilities we will all have to write on another system to cross compile or cross assemble.

Perhaps a Small C compiler of another system (ie: MSDOS, MacOS, CP/M) could be adapted to generate VML.

Eventually a VML assembler and other language compilers will then be written from scratch in VML so they can then be portable.

If anyone would like volunteer to be part of this sub-development team, ie: perhaps convert GCC to generate VML, please let us know.

Development Plan
================

This is the development plan as it stands currently.

1. Codename GENOS Awareness and Advertising (in progress)
2. Resource gathering (in progress)
3. Website (main one AND lots and lots of mirrors)

4. Mailing List (implemented)
5. IRC Channel
6. VML Specification (in progress)
7. Resource Allocation (in progress)
8. HAL Design
9. VML to Native code translator (cross platform version)
10. Initial HAL implementation
11. Development of simple command line shell (for testing)
12. Design of OS (to be written in VML)
13. Development of VML assembler (written in VML)
14. Development of VML 3GL (written in VML)
15. ...

Commercial Again?
=================

I had some people email me saying that a commercial project for redundant computers will fail. Why? Remember, it will likely be commercial, but FREE! Also, only the INITIAL target computers will be 8bit. Later targets might be current Alpha, Intel or PPC CPUs. If the project takes off - ie: people actually use the OS, then we may actually see a common future platform (ie: JAVA is not very platform independant cause it need too much resources for 8 bit computers). And also an 'efficient' OS for the faster CPUs.

Resources Needed
==========

All forms of resources are needed for this project.

1. Systems Analysts/Programmers to design and implement the HAL on each platform
2. Application Programmers to code programs in VML Assembler or a 3GL
3. Web page designers to design, implement and maintain websites
4. Administrators to maintain the mailing list, IRC channel
5. Beta testers to test everything
6. Artists to create cool advertising (on the web)
7. Brainstormers to give us suggestions

Names Needed
==========

As mentioned before, Codename GENOS really needs a proper name. Also this programming effort should have a name too - for promotion and identity.

Until Next Time

Regards

Julian Cassin

There was (is?) Concurrent DOS too which, if I recall correctly,
multitasks. Or maybe not.

Graham, The 64 files limit is for AtariDOS NOT SpartaDOS. Actually, I always thought it was 128 file, but... SpartaDOS supports subdirectories. At the command prompt type MKDIR or MD then the driive ID: and the new subdirectory name.
EX. D1: MD GAMES
This name uses the normal 8.3 file name structure. To switch to that subdirectory, use CWD >GAMES. This will shift to that directory. To get back to the main or root ditectory use CWD >. Be sure to have a space between the command and the >.
There could also be a formatting error that means that the image was actually formatted as 360K not 720K. I was never able to get the 80 track format to work, but then again, the XF551 drive doesn't support that.
Another suggestion is to try the 3.3 version of SpartaDOS. This works great for the emulators. If you need an SD 3.3 version .ATR image, I can e-mail you one.

Hi,

You listed an 835 as an acoustic coupler modem, the Atari 830 was the acoustic coupler, the 835 was a direct connect modem that did not need an 850 interface but instead it connected right to the 8-bit Atari computer. Also the 835 used a cartridge called Telelink II which had a nice feature, it would save 2 telephone numbers in its memory and it lasts quite a while, I hadn't touched me Telelink II cart for about 3 years and 1 day I just popped it in for the heck of it in and it still retained the telephone numbers.

Curt

```
******************************************************
===============VINTAGE MICRO-COMPUTERS===============
=============EMAIL: jonart@ix.netcom.com==============
******************************************************
```

Hi everyone. Anything on this list I will accept trades on. I am looking for interesting and rare C64 hardware and software, and anything Amiga related. This is going to be my first posting for Vintage Micro-Computers. The proceeds enable me to further my beloved hobby and also help others who collect/use/love old micro-computers. Of course my main love and area of expertise is the C64. I am in the process of moving into the world of the Amiga.

You will notice that I am trying to be as detailed as possible about my listings. I am a collector and have been buying items online for a while and I really wish everyone would list in a detailed manner. It definately makes it easier on the customer, so that they can decide if said item is useful to them or not. I will also try to answer as many questions as I can about each item listed.

This list keeps expanding(so check it regularly or request to receive updates via email). I have alot of items to inventory, check and clean. Email me your orders and I will process them as fast as I can. To make the transaction faster, please email your address with your order, that way I can calculate shipping and give you a total. Also... if you wish to receive future lists by email, send me email with subscribe in the subject line.

Please note that I will delete each of my for sale posts from the news group after 3 or 4 days, and then make an upgraded post.

So far Response has been great! Thank you to all who have placed orders.

Please enjoy and Happy computing to all!

------------------------------------------------------
*******************ATARI SOFTWARE********************
------------------------------------------------------
```

TITLE: Ultima IV - Quest of the Avatar
PUBLISHER: Origin
REQUIREMENTS: Atari 400/800,XL's, XE's and a 5.25 in floppy drive.

NOTES: This is one of the best series of games that has been on just about every computer platform at one time or another. This game is considered to be rare. The box is intact, although one corner is slightly bent. Everthing is in the box except for the metal Ankh. The cloth map is pretty groovy just for hanging on your wall.
PRICE: Well this is the difficult part for me. I am honestly not sure if I want to sell this since the Ultima games are my very favorites, and also due to the fact that the game is so hard to find. If I get an offer that sounds good I will sell this or even possibly trade it for C64 or Amiga items.
So go ahead and make a bid.

PRICE: $1.50 each

**********COMMODORE RELATED SOFTWARE**********

==========APPLICATIONS==========

TITLE: Fast Load Cartridge
PUBLISHER: Epyx
REQUIREMENTS: Commodore 64 computer
Cartridge
NOTES: This is the "famous" cartridge by Epyx that has a DOS wedge. Handy and easy to use. No manual, but there are docs on the web for it.
PRICE: $10

TITLE: Introduction to Basic: Part 1
PUBLISHER: Commodore Electronics, LTD.
REQUIREMENTS: Commodore 64 computer
2 Tapes
NOTES: Basic tutorial with many programs: "Testcard", "Hangman", "Speedtype", "Unit3Quiz", "Unit4drill", "Unit5quiz", "Sentences", "Unit7quiz", "Unit9prog", "Unit9quiz", "Unit10quiz", "Unit11prog", "Unit12quiz", "Sound Demo", "Heads", "Reaction", "Esg", "Craps". There is no manual or book for these tapes.
PRICE: $1

TITLE: OKIMATE 10 Learn to Print
PUBLISHER: OKIDATA
REQUIREMENTS: Commodore 64 computer or Commodore SX-64 or Commodore VIC 20
1 Tape
NOTES: This is a "How to" print tutorial.
PRICE: $1

TITLE: Super Expander 64
PUBLISHER: Commodore Business Machines, LTD.
REQUIREMENTS: Commodore 64 computer
Cartridge
NOTES: This powerful cartridge gives the user/programmer 21 new commands and 11 functions that lets you easily create hi-res graphics on your C64. Functions such as Drawing points, lines, arcs, circles, ellipses and polygons, create and animate sprites and special characters, combine text and high resolution graphics. Create music and game sounds Define programmable function keys, and much more! This

cart. comes with box and manual.
PRICE: $6.00

TITLE: Warp Speed Cartridge
PUBLISHER: Cinemaware
REQUIREMENTS: Commodore 64 computer
Cartridge
NOTES: This powerful cartridge icludes a Handy DOS Wedge(Similar to
the Epyx Fast Load Cartridge, but better), Menu driven features like:
View Directory, Sector Editor, File Utilities, Single Copier, Dual
Copier, Drive Command, Set Drives, ML Monitor, and Quit to Basic. A
great cartridge to use all the time or add to your collection. I will
send a photocopy of the manual if requested.
PRICE: $14

======================GAMES=========================

TITLE: Galaxian
PUBLISHER: Atarisoft
REQUIREMENTS: Commodore 64 computer
Cartridge
NOTES: Like the classic arcade game. Definately one of my favorites.
Addictive!
PRICE: $5

TITLE: Jupiter Lander
PUBLISHER: Commodore Electronics, LTD.
REQUIREMENTS: Commodore 64 computer
Cartridge
NOTES: Like the arcade game. One of the earliest C64 game cartridges.
PRICE: $3.50

TITLE: Temple of Apshai
PUBLISHER: EPYX
REQUIREMENTS: Commodore 64 computer, Data cassete
3 Tapes
NOTES: This is the famous game Temple of Apshai, an early dungeon type
game. I remember playing this for hours as a kid. This comes with a
box, all documentation, and 3 tapes. Highly collectable peice.
PRICE: This happens to be another one of those items I am not sure I
want to sell unless the offer is right. I will trade this for other
Commodore items too. Please make an offer.

**********COMMODORE RELATED HARDWARE**********

ITEM: VIC 20 Power Supply
DESCRIPTION: Small black VIC 20 Power Supply, old style with small two
prong female plug.
REQUIREMENTS: A VIC 20 computer
NOTES: Tested and works fine

PRICE: $5

ITEM: X1541 Cable
DESCRIPTION: This cable enables the user to hook-up a 1541 drive to
the parallel port of you PC to transfer files (Like the ones you got
off the web)
REQUIREMENTS: A 1541/1571 or compatable drive, A PC with a parallel
port, a copy of Star Commander (available all over the web, just do a
search)
NOTES: I have been transferring files from my PC to my commodore 64
for about a year and a half now. To make things easier I now have a
1541 drive attached to my PC at all times. I make these cables myself.
They look good and are durable. They are also tested prior to
shipping. I can make these in custom lengths (not to exceed 4 feet).
PRICE: $12

ITEM: Serial Cable
DESCRIPTION: You need one of these to use your floppy drive and your
commodore printer.
NOTES: I make these custom so you may specify a particular length you
require (not to exceed 4 feet). They look good and are durable. They
are also tested prior to shipping.
PRICE: $8

==========FLOPPY DRIVES==========

ITEM: Commodore 1541 Floppy drive
QUANTITY: 3
DESCRIPTION: 5.25 inch floppy drive (serial)
NOTES: Drive powers up lights come on. yet drive does not work, more
than likely an alignment problem. You may be able to re-align these by
using software and documentation Via the web(I have been lucky on
several occasions doing this), I just simply do not have the time to
mess with these. Worse comes worse they can ban used for parts for
another ailing 1541 drive. No power cable included(you can pick these
up at Radio Shack or most computer stores).
PRICE: $5 each.

ITEM: Commodore 1541 Floppy drive
QUANTITY: 2
DESCRIPTION: 5.25 inch floppy drive (serial)
NOTES: Drives work great. No power cable included(you can pick these
up at Radio Shack or most computer stores).
PRICE: $15 each or $20 with a power cable.

==========JOYSTICKS==========

ITEM: Wico Command Control
DESCRIPTION: This is a high quality joystick that has a fire button on
the base and one on top of the stick with a selector to switch between
the two. A great joystick that has an excellent feel to it, definately
a tool for the pro-gamer. Very clean!

REQUIREMENTS: For use on most 8 bit commodores and 8 bit atari
including the atari 2600
PRICE: $6.00

ITEM: Competition Pro Joystick
DESCRIPTION: This is a high quality joystick that has two buttons on
the base(for left or right hand players not fire button A or B).
Definately a tool for the pro-gamer. Durable construction and very
clean.
REQUIREMENTS: For use on most 8 bit commodores and 8 bit atari
including the atari 2600
PRICE: $5.50

ITEM: Wico Black Max
DESCRIPTION: Small mid-quality joystick with a fire botton on top.
Works great and clean.
REQUIREMENTS: For use on most 8 bit commodores and 8 bit atari
including the atari 2600
PRICE: $3.00

ITEM: Gemstik
DESCRIPTION: Small mid-quality joystick with a fire botton on base.
Works great and clean.
REQUIREMENTS: For use on most 8 bit commodores and 8 bit atari
including the atari 2600
PRICE: $2.50

**********TI 99/A CARTRIDGES**********

ITEM: A-Maze-ing
DESCRIPTION: Maze type game.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $1.50

ITEM: Car Wars
DESCRIPTION: Arcade type game.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $3

ITEM: Munch Man
DESCRIPTION: Pac Man clone.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $3

ITEM: Parsec
DESCRIPTION: Probably the most well known early cart. game for the TI.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $3

ITEM: TI Invaders
DESCRIPTION: Space Invaders clone.

REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $3

ITEM: Addition and Subtraction 1
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Beginning Grammar
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Early Learning Fun
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Meteor Multiplication
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Multiplication 1
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Number Magic
DESCRIPTION: Educational Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $0.75

ITEM: Music Maker
DESCRIPTION: Music Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $1

ITEM: Household Budget Management
DESCRIPTION: Home Finance Software.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $1.25

ITEM: Personal Record Keeping
DESCRIPTION: Simple database program.
REQUIREMENTS: A TI 99/A with a cartridge port.
PRICE: $1.25

**********SHIPPING INFORMATION**********

Customer is required to pay all shipping charges. Just send me your
name and address with your order and I will calculate shipping. Most

books (if they are not too heavy) I can send priority mail (3 day) for about $3 anywhere in the Continental US. Also please note that some days I am rather busy, so give me a couple of days before I ship (I will always try to ship day of order, but I do have a full time job.)

Checks(I will accept personal checks but I must wait til they clear the bank before shipping) or Money Orders must be made payable to Jon Lucas.

Sparta uses a different set of error messages. ERROR 169 in Sparta means "disk write locked".

Sparta versions prior to SDX did have a 128 file per directory limit; SDX supports well over 1000 files per directory

Simple: It's Windoze! :-)
(Windows: The first SOS! (Semi-Operating System :-) :-)

Well, this thread should be moved to some more accurate newsgroups,
since all the ones this is posted to have nothing to do with windoze.

Howdy folks

More memory questions.

a) do 16MB chips exist?
b) is there a 16MB chip that's either
SRAM, Pseudo SRAM or takes 256 cycles
every 4 ms as a refresh?
c) what do these suckers cost?

2526. 64 file limit SpartaDos

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-09 00:00:00 UTC
From: sysop.fox-1@stackbbs.xs4all.nl
Message-ID: <877037178@stackbbs.xs4all.nl>
Source record: 69485

```
< Error 169 >

This error-code indeed means 'directory full', but... Sparta-Dos handle's
up to 127 files/directory. A sub-directory also counts as a file-entry...

A while ago I've heard of some people having problems when using the 3.2G
version of Sparta-Dos, some problems with opening & closing files.
I know APE recomments this version when using the APE-super-warpspeed, but
maybe you should try another version of Sparta-Dos. 3.2C and 3.2D are
'better' versions, but they're using the older syntax, like CWD (change
directory) and ERASE (del).

Me myself am using version 3.3b. This is an 'updated' version, made with
the source's of 3.2C (if I'm right). It also has the US-Doubler-highspeed
SIO-routines built-in, and when used with APE (with KEY OFF) it'll surely
do the job at the highest speed when _reading_ image's. Don't know about
writing to an image since I'm not a registrated APE-user...
Oh, 3.3b is using the MS-DOS-like syntax, like CD & DEL to change
directories and erasing files, but the
older syntax is still supported...

Well, thanks to all the people who've responded. I found a very
nice technical thread, considering the pros and cons of pre-emptive
and multi-threaded OS's. (I just love delving into the technical
aspects.) And now better-appreciate the pre-emptive OS I use.

Now, would anyone care to discuss why Win95 m.tasks so badly?
(seriously... I'm impressed with how well Win95 works, considering
what a kludge it is. But it's m.tasking certainly doesn't seem
to work -that- well yet...)

Nathan.

I just have to say that, for anyone -really- interested in the z-code
interpreter, (ie: text adventures), you must look at the if-archive:
ftp.gmd.de/if-archive
No other place you need to look.
Not one.
Nope.

(They've recently received much information on the Magnetic-Scrolls
adventures too, coooool.) :-)

Not forgetting all the Level 9, Scott Adams, blah blah waffle waffle....

:-)

Nathan.

The Austin-Franklin 80 column card replaced one of the Atari 800 memory boards. I doubt it could be interfaced with an xl/xe without major modifications.

It was reviewed in ANALOG #12 or 13.

(Now I'm tempted to get an 800 and a great 80-column board for it - must resist temptation...)

David,
I thought it was 128. I just looked up the file count/dir...1423
entries/dir. However error 169 isn't even mentioned in the SDX manual I have.
Error 162 is the disk full error code for SDX.

2535. Atari BBS List 10/8/97

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-09 00:00:00 UTC
From: Trevor Holyoak <trevor@holyoak.com>
Message-ID: <343CD3D7.8ED3CFE4@holyoak.com>
Source record: 69565

<note: I update and post this to comp.sys.atari.8bit as often as I get a
few updates. The
most current version is always available online at
http://www.holyoak.com/atari/>

Atari BBS List 10/8/97

Maintained by Trevor Holyoak <trevor@holyoak.com>

Please keep me informed with updates to the list and I'll post revisions

as necessary. In particular, if one of the BBS's is within your local
calling area, please give them a call and let me know whether they're
currently operational.

All boards are assumed to be operational 24 hours a day, 7 days
a week unless otherwise noted.

The format of the individual entries is below.
Note that each entry uses at least five lines (all of which are
less than 40-columns in order to make this easily 8bit readable):
"Type" indicates the type of hardware used to run the board.
"Status" is whether the board was up or not the last time it was
checked.
"Status Date" tells you when the entry was last updated.
--
There can be one or more lines of "Notes".

An asterisk (*) next to the board's phone number indicates that entry
has been updated since the last version of this list.

If any other individual/organisation would like to take over maintenance or
perhaps just mirroring this site, please contact me.

Project Coordination
====================

A couple of things I would like to make everyone aware of. Although I have
started this project, I am not the only person who is creating the ideas. I
am not the owner of the project - there isn't one owner, but currently the
driving force. Every individual/organisation involved in this project will
eventually be part owners - even the one's who critise a lot - cause their
critisisms are always listened to and can be constructive.

Resources are one area that can be risky - if you are intending to get returns
from your investment towards this project, there is not garauntee of that.
Many people are doing this for fun, for their own personal learning, for
ideas, for the possibilities of making the computing world a better one and
for gaining knowledge and understanding about operating system concepts and
different methods of implementing them.

On the GENOS Website, there are a couple of tables of people from the mailing
list and what roles within the project they have volunteered for. Currently
there are many 'Possible Programmers' but I would like to know if anyone
really would like to devote time to the project. Remember, nothing with this
project is a commitment, so if you intend to now, but change your mind, that
is OK. It is a 'commercial public' project. This project does not
discriminate anyone.

If you are not a programmer, but have asked to be on the mailing list because
you would like to contribute something, read the 'Resources Needed' section,
programmers only fall into a couple of the categories.

If you would like a particular role in this project and 'hope' to fulfill this
role, please let me know what it is. If there is a skill I have missed, let

me know.

The Next Stage
==============

Currently I am working on the VML\HAL specification - the BASIC principles behind these will be sent out hopefully within this week for everyones comments, opinions and critisms. Hopefully some simple theoretical example's will also be given to demonstrate the usage of the HAL and VML.

Regards

Julian Cassin

>second) automatically without the program's request or permission, hence
>the term preemptive.

Let me add: an OS that is only pre-emptive is the least efficient way
to allocate CPU time (even though it may not seem that way because
pre-emption prevents 'bad' programs from blocking user I/O for
extended periods of time, a la Windows hourglass) because the
application is interrupted on an arbitrary basis and not when it's
just waiting anyway (e.g. waiting for a file read operation or a user
keystroke).

> In a non-preemptive system (DOS, Win3, Older Macs), each program
>must explicitly hand control back to the OS every so often (by calling a
>system function) so that the cpu can switch to another program. If a
>program fails to do this, it will run forever and no other programs will
>run.

There is a better term that "non pre-emptive", and that's
"co-operative". UNIX, for example, is both co-operative and
pre-emptive; any call to the operating system is considered a
voluntary relinquishment of the CPU, which results in applications not
spending a significant amount of time polling for events such as
interprocess communication. Only applications that are purely CPU
bound (e.g. long complex calculations) are pre-empted if necessary.

Good co-operative applications make sure that they check for
interprocess communication frequently so that other applications are
not starved for CPU time. Bad co-operative environments (16 bit
Windows) do not provide facilities to allow more than one application
to talk to the operating system at any given time, and thus couldn't
execute a second program while the first is waiting even if they had
made the effort to interpret all OS calls as co-operative.

> Now, multithreading is a finer hair to split.

Your explanation was good but I would add that, on a lower level (OS
or device driver), multithreading means a single block of code keeping

separate data for separate concurrent operations. This is required,
for instance, if a disk driver has to begin a disk read request for
task #2 which the OS is executing because task #1 is waiting for the
result of a disk read operation that hasn't yet been completed
(perhaps the drive's head is still moving to the cylinder where the
data can be found). This is precisely what is missing from the IBM PC
BIOS and from MS-DOS, which is why Windows 3.1 can't switch tasks -
co-operatively or pre-emptively - during long sessions of disk I/O.

>ps. Win95 is an interesting case. It tries to be a preempting
>multitasker, but fails miserably due to all the 16 bit code hanging around
>in the OS (can you say "thunking"? I knew you could :-) So instead of one
>program hogging the cpu and freezing the system, you can have the OS
>hogging the cpu and freezing the system. How's that for progress.

Windows 95 tries to solve the problem the same way that UNIX does: it
skips MS-DOS and the BIOS wherever possible... but it keeps the
ability to use 16-bit drivers for compatibility's sake (as users of
UNIX, NetWare, QNX, OS/2, NT, etc. can attest, there's never a good
protected mode multithreaded driver around when you need one). So, if
you buy hardware from a company that can't - or won't - write a
multithreaded driver, then you get bogged down. Don't feel so bad:
under UNIX, you couldn't use that hardware at all, let alone with
system performance ramifications.

Microsoft's excuse for not pre-empting 16-bit software in Windows 95,
on the other hand, is truly lame. They did it just fine in NT, and I
think that they didn't do it in 95 just to add to the list of things
that NT does and 95 doesn't.

Chip packaging tends to follow standards for number of pins. Given a chip of a certain die size and the desired mounting method (surface mount, various sockets, etc.) there's a certain selection of pin counts available. i.e. You design a chip that requires 37 pins, but the most commonly supported external pin count is 40 for that size of packaging then you save yourself some money and put the chip into a 40 pin package instead of asking the chip manufacturer to retool their machine for 37 pins.

Did it actually "replace" a memory board, stealing 16K? I thought it
only resided in one of the slots. If you had a 16K and a 32K board
you could still have all your ram with an Austin 80.

>It was reviewed in ANALOG #12 or 13.

>(Now I'm tempted to get an 800 and a great 80-column board for it - must

I know what you mean. I lusted for an 80 column COLOR display for
years. Too bad Jack came along with his cost-reducing disaster. C64
users got the 128 which does 80 columns (in color AFAIK) and we just
got the same old 8-bit built with cheaper parts.

Out of curiosity, why would you want to move it to the left slot? The left slot in the 800s is the normal cartridge slot and is considered the 'first' slot. The right one is the 'second' slot... if I remember correctly...

I'd love to have 80 columns on
> my computer, <snip> Does the Austin 80 need
> special drivers? Oops, almost
> forgot, is it b/w or color?

No, the board has the drivers in the right slot cartridge. They work with any program that uses the BIOS screen calls...like BASIC...I don't remember what else....but there are special versions of Letter and Data perfect specifically for the Austin 80 because they had embedded screen drivers. There was an RGBI color option....and that was really cool, especially for the time (1982)!

> How is this Austin 80?

Personally ;-) I think it was an excellent product for the time....it was quite an engineering effort....but Atari changed their marketing...and product line...

> - would it be PBI (read BlackBox)
> compatible?,

>
> BTW how is it connected to the
> screen?

It only works in the Atari 800. I don't know what PBI is.... It is connnected to the screen via a cable that runs under the removeable top of the 800 out the back side. It connects to the normal 40 column output, and allows it to pass through when 'needed' ie. a game. It also has a light pen input (no body really supported it in software...but it is there...).

If enough people were interested, I could post the documentation I have in ..jpg or .gif... I really don't want to type it all in now...but eventually, I guess I will.

Thanks for the interest!

2544. Help us fill POOLDISK II CD with public domain software

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-09 00:00:00 UTC
From: ernest@pi.net
Message-ID: <343d596d.4627858@news.pi.net>
Source record: 69574

We are currently working on POOLDISK II. For those of you that do not know what this is, in October 1995 we created a CD-Rom filled with public domain programs for the Atari 8-bit systems. It also contains shareware, freeware and everything else that can be distributed freely. All the public domain diskettes we have in our collection have been copied to a PC with SIO2PC. The POOLDISK CD thus contains over 2300 files in the well known ATR format. These can be used with a real Atari 8-bit computer, by using SIO2PC or APE, or with the various Atari 8-bit emulators that exist.

We are now working on the second version of this CD. Since prices of blank CDR disks have dropped a lot compared to two years ago, we can sell the new POOLDISK II disks at a very low price. This is a great opportunity to save all your own public domain disks and other disks and material that can be copied freely. If you send us a copy of whatever you have, we can add it to the POOLDISK II, and this way, we can help each other. You will be able to get a backup of your disk collection, and everbody else will be able to use the stuff too. Any text files or any other material like pictures that can be stored on a CD is also welcome.

So please check the stuff you own, and if there is anything that you would like to share, send us a copy. If you have some programs or utilities that you wrote yourself, and did not think other people would be interested in, now is the time to share it with everyone, since we have lots of space on a CD-Rom. Ask your friends and fellow Atarians too. We hope to be able to start production of the CD by the end of November, so make sure you send us your stuff before that time. We really need your help now. We have gathered some 100 Dutch disks for the new CD, but we think there must still be hundreds of programs out there that deserve to be on the CD, so if you have any stuff, in any language, we need it ! If you are unsure about whether or not stuff is already on the POOLDISK, send us a list of the stuff you have and would like to send us.

Our original POOLDISK was sold at US $ 35, but we can produce the second POOLDISK much cheaper. We have not yet set a fixed price, but the POOLDISK II will be sold at half that price or less! Note that this price is not fixed yet, as we are still considering the option to make it a double-CD. But rest assured that this CD will be real cheap. If we receive lots of stuff, we can make this a double CD, so do not hesitate, send us everything you got !! You can E-mail stuff to me using my address: ernest@pi.net or you can send it by regular mail to:

Ernest R. Schreurs
Kempenlandstraat 8
5211 VN Den Bosch
The Netherlands

Keep those XL's/XE's humming!

2545. Reading Atari 800 disks with PC?

The ROM files are available thru <http://www.emulation.net/>, at
<http://www.emulation.net/atari800/atariroms.sit.hqx>.

Clever Mac-using readers will note that they are BinHexed StuffIt files,
which non-MacHeads may have trouble unarchiving.

2550. Mac - Atari Transfers

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-09 00:00:00 UTC
From: bbaker@mail.nospam.usyd.edu.au
Message-ID: <bbaker-0910971418140001@mp-13-46.mp.usyd.edu.au>
Source record: 69580

Sorry to dredge up this topic again, but while we are talking about Atari - Mac transfers, how about the other way around?

What are the specs for the null-modem cable I'd have to build? Would it be the same as the one listed in the Rainbow readme, and detailed earlier, that is, the one going from the 8 pin Printer Port of the Mac to the I/O 9 pin on the atari?

Once I have my hands on a cable that will actually connect the 2, I simply need to get atari terminal software, and zreceive files from the Mac, correct?

Thanks a lot --

- Muttley

I believe strongly they are. (As does everyone-else I know.)
I also believe they really wish to destroy java.
Therefore I must hate the bastards.

Luv'n'hugs,
Nathan.

My Atari Portfolio PC Card Drive driver (CD.SYS) apparently won't work in a Windows 95 environment. Is there a way to deal with this? I've used the Port for years and I love it--but it's appeal is its ability to talk to my PC, and my parallel connector broke long ago.

2556. XL Search comments...

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-10 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <61kjlr$k2h$1@nuke.csu.net>
Source record: 69490

I've (finally!) cleaned up a bunch more .blurb files at UMich, so
XL Search's file database is up to 435 files.

I've noticed, looking at the logs, that many people try entering
file names. While this may be kind of like looking for yourself
at Alta Vista, let me suggest that when you are actually looking
for something, you try entering more descriptive words than just
filenames.

Also, take advantage of the (bugfixed) keyword "+" and "-" symbols
and the (new!) sort-by-matches feature to get the most relevant
entries first.

Enjoy!

And remember, if you have an FTP site, make a QIF file for me and I'll
incorporate YOUR site into XL Search! :)

P H A N T A S I E

The object of the game is to defeat the Black Lord and end the reign of terror of the Black Knights on Gelnor. In order to destroy the Black Lord, you must obtain 9 rings and 4 runes from the dungeons and towns of Gelnor.

THE TOWNS: OBJECTS

Town 01: Pelnor
Town 02: Pineville
Town 03: Greenville
Town 04: Hobbiton
Town 05: Appleton
Town 06: Splitwater
Town 07: Trollport
Town 08: Phantasia Location of ring IX- must teleport here
Town 09: Dragonor
Town 10: Northford

Town 11: Starville
Town 99: Olympia

DUNGEONS LOCATIONS

Dungeon 01: Door in Hillside Near Pelnor
Dungeon 02: Cathedral Near Pineville
Dungeon 03: Cave Near Greenville
Dungeon 04: Woodville South of Greenville
Dungeon 05: Lord Wood's castle Near Hobbiton
Dungeon 06: J.R. Trolkin's castle West of Dragonor
Dungeon 07: Donesbian temple West of Northford
Dungeon 08: Island Dungeon North of Northford
Dungeon 09: Mt. Olympus East of Olympia
Dungeon 10: Gateway into mountain West of Starville

NOTE: Complete these dungeons in the order that they are listed.

Magic Pools are pools that enable you to eventually get the Water Rune from dungeon 05. They are located in different places of Gelnor, and you must immerse all of your characters in each one.

MAGIC POOLS LOCATIONS
01 Near Pineville
02 Near Trollport
03 Near Phantasia. This is the trickiest pool to find. It is in the water and you must look for a discrepancy in the waves to find it. It is on the same screen, but is NW in the lake surrounding Phantasia.

Scrolls: are items you will find in some dungeons which will be very helpful in the game. They give hints, and general history of the object. You read the scrolls by U)sing them at a town. There are a few scrolls which you don't find in the dungeons. They are: Scroll 8 (buy at Pelnor in the beginning of the game), and Scroll 18 (which is the scroll given to you by Filmon the Sage at the end).

The Runes: are items you need to complete the game. You need all 4 runes (Air, Earth, Fire, Water) to pass the tests of the gods at Mt. Olympus and obtain the God Rune which will enable you to enter Dungeon 10.

The Rings are also items that you need to complete the game. You need all 9 rings to pass the test of rings at Mt. Olympus to obtain the God Rune.

DUNGEON ITEMS

01 Air Rune, scrolls 1-3, 9
02 Earth Rune, scrolls 10, 11, 20
03 Fire Rune, scroll 5
04 scrolls 4-5, 12, 14, 19
05 Water Rune, scrolls 6, 7, 13, 15

06 Rings I-III, scroll 17
07 Rings VII-VIII, scroll 16
08 Scroll 1, rings IV-VI
09 God Rune
10 Wand of Nikademus, Black Lord, Dragon Kings, Divine spell

DUNGEON 01:
There is a library in the South-East in which Scrolls 1,2, and 3 can be found. To the South West lies Kilmor's room, in which Scroll #9 and a cache of weapons lie. Etched on the wall of this room are the words 'NIFLE SCRO'... They will be needed later. The most important item to be found in this dungeon is the Air rune. To get this, you must do two things. The first is to press a button in mid-west portion of the screen...(Note: there are 2 buttons, one of which sets off an alarm). This button opens the gate to the Air rune. Then, travel down to the Southernmost part of the screen and follow a corridor along the bottom and up the west side... At the end of the corridor you will find a lever... Pull it to open the way to the exit... Then, in the North-west part of the screen, you will find an old man... Talk to him, and he will give you the Air rune.

DUNGEON 02:
You find the Earth rune in this dungeon and quite a few scrolls. When you encounter the old man, ignore him and he will reveal a secret passage to the south. Buy the secret from the orcs for it enables you to get a scroll from the trolkins. None of the coffins along the walls are important. When you encounter the dwarf, say "NIFLE SCRO". The key at the bottom of the dungeon enables you to open the door that has the lock that no one can pick. In the room with the impassable monks, there is a secret door on the east wall leading to the high priest which you must talk to and obtain scrolls from.

DUNGEON 03:
This is one of the hardest dungeons to map because of the many twists and turns in it. A little bit South and East of the entrance lies the Fire Rune. After slaying 2 Fire Elementals, it is yours. It will now allow you to travel to Dungeon 2 and burn the box to get the Earth rune. In the North East portion of the maze can be found a warrior. You have to go through a secret door and a small portion of water to reach him. He carries some good weapons and Scroll #20. In the South west portion, there is another warrior, and he carries Scroll #5. At the Southern part of the maze, you will find two people who need to be rescued. Rescue the man, not the woman. He is the uncle of Lord Wood and he gives you the phrase 'Straticon Uble and 48'. This will be used later. When mapping this dungeon, it is important to remember that whenever it seems as if you are trapped without an exit (such as in the Arena) you should search for secret doors to make your egress...

DUNGEON 04:
It is in the form of a town. In the North west, you can find a

Scroll shop... When asked if you want to buy 3 scrolls, say yes (they are only scrolls 1,2,3, but if you don't buy them, the man won't let you into his shop)... There is a secret storage room that lies through a secret door. In it is a chest holding Scrolls 4,5, and 14. In the South west portion of Woodville lies an inn. In Room 1, Kilmor can be found. Tell him 'Niscottan says hello', and he will give you the Sacred number 79. Another Sacred number,45, can be found in the hall of records in the middle of Woodville. Now we go to the temple in thE mid-West portion of the town. Go west until asked to press a button. Press 7, and then go west again. Press 9 to finish entering the number 79... Do this again for the number 45, and also for the number 48 that Lord Wood's uncle gave us in the phrase 'Straticon Uble and 48'. Then go to the priest to the west and say 'Straticon Uble'. He will give you Scroll 12. The two other Sacred numbers opened up a normal door in the top of the fountain by the entrance, and a secret door in the bottom of the fountain... The top door leads to a few tough battles and a God Knife, while the bottom door leads to Scroll 19.

DUNGEON 05:
In the dark closet, there is a secret door in the NW corner.
To pass the tiles, go the directions given to you in the closet: SWWSSESSWWWSSEEEEENEEE. To enter the room of the Pools, you must have entered all three pools. Within this room, is the water rune.
Search for the secret door on the west of the great hall leading to the key that opens the jail cell in the bottom of the dungeon.

DUNGEON 06:
Almost as soon as you enter, you will be teleported to a jail cell... There is a secret door in the south wall of the cell, and a few steps south of that, there is another secret door in the west wall. Follow this corridor to the west until it comes to the Secret Control room to the South. You will find 3 levers to pull. Lever 1 opens your Jail cell. Lever 2 opens a door out of the arena. Lever 3 opens the magic door in J.R. Trolkin's room that guards Rings 1,2, and 3. (J.R. Trolkin's room is to the east of the Control Room)... Return to your Jail cell and go through the newly opened door. You will find a guard room. A corridor to the North will lead to a room with a key that will let you out of the castle. There is a library with battle maps to the South East of the Entrance, and it holds Scroll 17. The door blocking the exit can be opened by the aforementioned key.

DUNGEON 07:
To enter this town, you must have a Minotaur character in your party. This can be obtained by generating Random Characters until a Minotaur comes up. Then, just replace your weakest character with the Minotaur. (Note: The Minotaur does NOT have to be alive, so don't worry if he dies, because he certainly will...). You will come to a priest who will ask you what the password is. You merely reply 'REVEN TONEM' (which was obtained from Scroll 19) and enter. If you don't

want to talk to him, there is a secret door on the East wall just
before you come to him. You will be in the main temple. Take the 3rd
corridor on the East wall of the temple. Deface the statue you find
in there. Then go South into the Hall of Caskets. Open the 3rd door
on the West wall, and get the key. Go to the South West corner of the
main temple then and go South through the secret door (which was
opened by defacing the statue). You will find a library with Scroll
16. Then go back to the 2nd corridor on the East wall of the Main
Temple. Open the door with your key. From here, you can go to the
jail cell at the bottom of the screen. You can get a key from Kilmor,
who is in the second cell. Go back near where you opened the door
with the key, and you will find another door. Open this door with
Kilmor's key, and enter the room. Get Rings 7 and 8, and go North
through a secret passage to exit, or else battle your way through
many monsters if you'd rather.

DUNGEON 08:
This dungeon contains multi-colored bleebs which give
you information to eventually find the rings. The blue bleebs
always tell the truth, the red bleebs always lie, and the green
bleebs sometimes lie and sometimes tell the truth. The blue pools
do damage, the green pools teleport, and the red pools enable you
to access the lower part of the dungeon. You must enter all 3 of the
red pools, however. After entering all of them, you enter the green
pool in the center of the screen (a little to the left), and it will
teleport you to the bottom of the dungeon where there are many doors.
Don't enter the green door because it's a dead end. The blue door is
an exit, and the red door leads to the rings and the king bleeb. When
you get to the unidentified bleebs talking, push the green button.
The answers to the 3 questions to get the rings are: green, red or
green, red.

DUNGEON 09:
Mt. Olympus is a fairly simple dungeon. All you need to do, is
enter all of the rooms carrying all 9 rings and all 4 runes, and
pass the tests of combat, rings, and runes (air, earth, fire water).
After passing all the tests, go to the south passageway and
get the God rune from Zeus by kneeling before him.

DUNGEON 10:10:1ou need the God Rune obtained in Mt. Olympus to enter here.
In this dungeon, you must go the lower left to find a teleporter
that will teleport you near the black lord. You must destroy the gems
in the throne room, and not sit in the throne. There is a secret door
behind the throne. Attack the black lord and get his wand. Wave it,
and talk to Filmon the sage. Kill the black lord and gain the divine
spell. HINT: Use a confusion spell so he can't cast spells!

This is the end of the game! The divine spell is a mass resurrection
spell. You use the wand, the rings, and the divine spell in:
Phantasie // (according to a person at SSI).

My answer:

At newsgroups elsewhere I have read, that it shouldnt be possible. But I
dont believe that.
I programmed some assembler code with direct access of the disccontroller
some months ago.
Ok I am little bit lazy to keep on programming.
The result: Some sectors I can read (the first some good, some bad), then
the program hangs up.

> Out of curiosity, why would you want to move it to the left slot? The left
> slot in the 800s is the normal cartridge slot and is considered the 'first'
> slot. The right one is the 'second' slot... if I remember correctly...
```

I�d like to discuss the differences betwenn the right and the left slot.

```
IMHO the left slot is a "full" slot with all the RD4/RD5 and S4/S5
signal lines.
The right slot only supports the RD4 and S4 lines.
```

That means, that left slot cart�s could use adress space from $a000 to
$bfff and from $8000 to $9fff while right slot carts could only use
$8000 to $9fff.

```
So every right slot cart should work on XL/XE too.
```

But I�m not an 800 specialist - please correct me, if I�m wrong

```
Matt
```

A while back we were discussing the origins of Atari's name. I offered to dig out an old article describing the origins and showing the three diferent logos the Atari company used throughout its life, and someone said they would be interested. Well I finally got by butt in gear and scanned the article.

Sorry the images are in bulky BMP format, I dont have a BMP to JPEG converter handy.

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

Enjoy

Graham.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design, and if you look at the middle logo [MLOGO2.BMP], you will be able to make out both letters.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

You're sick of these postings, I'm sure... but:

* XL Search now has over 500 files in the database.

* Whenever you get 0 matches, there's a link to an Alta Vista search
for the same keywords you entered! This is great if you enter, for
example, a commercial title. Since there won't be any in the XL Search
database, you can head to Alta Vista and find who might be selling
the game.

* Coming soon! For those of you without Web access, you'll soon be able
to send e-mail requests to XL Search and get instan replies!

Feedback is always welcome! If you have trouble with the site, questions

2564. Anyone have 800 cartridge pin out?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-10 00:00:00 UTC
From: Austin Franklin <dark4room@ix.netcom.com>
Message-ID: <01bcd5cb$33ef4f10$d449bacd@drt1>
Source record: 69498

Hi,

Anyone have an Atari 800/400 etc. cartridge pin out?

Thanks,

Austin Franklin
darkroom@ix.netcom.com

2565. XL Search update part 2!

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-10 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <61mcdlljp1@nuke.csu.net>
Source record: 69499

XL Search is now accessible via e-mail! So, if you don't have Web
access (not even "lynx"), you can request searches by emailing:

To: kendrick@zippy.sonoma.edu
Subject: xlsearch (all lowercase)

The Body of the message should contain at least one line which
begins with "K: " (captial "k", colon, space) followed by
the keywords you want, in the form used by XL Search.

For example:

K: pac+man pacman

would find all files which said either "pac man" or "pacman" in them.
(if you did just "K: pac man", you would get all files with the word
"man", "manual", "packer", etc.)

You can have more than one "K: " line if you wish, but it all counts
for the same search.

The results are based on a "lynx" call to XL Search.
Responses are immediate (it's automated, I don't have anything to do with
it)

:)

Also, as you may have noticed above, I used the form "pac+man".
This is brand new, too... it lets you stick words together to create
a multiple-worded keyword. :)

This is just a curiousity post mostly about 5200 games. I only have some sort of project to work with them but I just need to see what your opinions are on things...just to see if I want to persue this or just forget about it. Ok, here goes...

- What's the best and the worse 5200 game IYO?

- Which 5200 games are "better" than the 8-bit version

- How do you like 5200 joysticks? (Like I need to ask...)

- Would you really like to play 5200 games on 8-bits if you could, even if they're "hacked"?

kendrick@zippy.sonoma.edu (William Kendrick) writes:

> Very interesting! I had always thought (and seen documented, and
> documented myself) that "Go" was a Chinese game, not Japanese!

Like Zen, its origins are in China, but the Japanese have made it
their own. The Chinese still play it with slightly different rules, I
think.

Brent

2569. Thank God for the FAQ

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-10 00:00:00 UTC

This is just a Thank You..
(The FAQ at http://www.faqs.org/faqs/atari-8-bit/faq/)
There's a lot of great stuff in the Atari 8-bit FAQ but
I wanted to focus on one small list...

As a computer collector and an Atarian, I naturally haunt
flea markets, garage sales, rummage sales, thrift shops
and so forth in search of Atari equipment. Often the systems
I buy have nothing except the unit, but I've never found a
system that didn't work. Just as often, however, I find
a power unit with no sign of a system - and that's where the
FAQ comes in. It's such a small part of the FAQ, but section
13.3 that documents the power supplies allows me to buy a power
supply whenever I find one, identify it, test it and then use
it for the appropriate system. Since most of the units have
the specs written on them it's not that hard anyway, but it's
so nice to have the list. Used it again TODAY for that reason.

Thanks to Michael Current and thanks to all the former Atarians who
contributed to the FAQ and who will do so in the future.

Bruce Gomes

Hi!

You should definitely visit the 5200 home page and get a copy of the
5200 FAQ which includes cart ratings and some of the other info you
seek. The address is:
http://www.atarihq.com/

> sort of project to work with them but I just need to see what your
> opinions are on things...

More info about your project might change our opionions. Better to ask
than guess! ;-)

> - What's the best and the worse 5200 game IYO?
My favorite three 5200 games would probably be:
Joust, Space Dungeon, Star Raiders
Miner 2049 is also highly rated...

After thinking about "worse" titles, I really can't say that there are
any of the released 5200 titles that I don't enjoy to some extent!
(Ooops, I just peaked at the FAQ's worst and best list... maybe Congo
Bongo is the worst of the games released for the 5200...)

> - Which 5200 games are "better" than the 8-bit version
Offhand I'd have to say "all" but I think there are probably a few
exceptions where I prefer the 8-bit versions (paddle games used to be
better on the 8-bit machines until I made a 5200 paddle controller.)

> - How do you like 5200 joysticks? (Like I need to ask...)
Love them, when they work. Problem is they corrode faster than a VW Bus
in Santa Cruz. I also like to keep a Competition Pro handy for games
that don't require the analog input of the 5200 stick plus I've
converted a number of 8-way "digital" sticks to work with my 5200 as
well.

> - Would you really like to play 5200 games on 8-bits if you
> could, even if they're "hacked"?
Nope, enjoy them just fine on my 5200 (care of Sean Kelly's Multi-Cart.)

Seeya!

2571. Re: difference between cart-slots (Re: Austin 80)

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-10 00:00:00 UTC
From: Austin Franklin <dark4room@ix.netcom.com>
Message-ID: <01bcd5a1$6629d600$31f65ecf@drt1>
Source record: 69505

Matthias,

Along with the address decoding you have listed, which I believe is correct, there is at least one 256 byte spaces too, which I believe are 0xD5xx. The cartridge we developed for the 80 column board used this space so it would not interfere with the memory addressing of any cartridge used in the left slot. The cartridge used a bank swapping technique to get a 4M EPROM to occupy only 256 bytes of space in the 0xD5xx region.

That is why I was curious why anyone would want to move it to the left slot...the left slot on an 800 is the one that anything can work in. The reason for two slots, as far as this machine was originally concerned, was to have two 8k cartridges...for what ever reason... so for all practical purposes, the right slot was useless except for special pieces of hardware, like out 80 column board or some firmware debuggers I believe used this slot too...

Austin Franklin

Cool! Be sure to add my "Gem Drop" game to it! :)
(http://zippy.sonoma.edu/kendrick/nbs/atari/games/gemdrop/)

It might also be cool to have a simple .HTML file which links to all
of the known Atari 8-bit sites and summarizes them...

Hey, I thought I was the only one who has thought of this!! How do you
power it? Is it a big drain, especially when the car is off?

Sounds like a perfect use for my 600XL.

Actually, early on the much publicized reason for the name was that "Atari"
meant "Checkmate" (chess) in Japanese. Of course, I don't speak the
language so I have no idea if this is even remotely true.

Richard

: IBM Compatible 80x86

The PC is not abandoned.

How can you write for 8-bit systems and 16/32 bit systems at the same time due to the limitations, especially in the 6502, in regards to facilitating multitasking and memory management, not to mention throughput???

A hardware abstraction layer won't be able to get a C=64 to run a program that requires at least an 030's worth of throughput and over 500K of linear addressable RAM, not to mention 640x400x8-bit color graphics for its GUI...

I think this is just darn silly.

Certain assumtions have to be made about the hardware. These days, the assumtions would be:

at least 8-bit digital audio.

at least 640x480x16 colors (well, really 8-bit color but for ECS I'll be understanding) with a 24-bit palette.

at least 50mhz 030 throughput which is already half of an 040/28 and many many times slower than today's Pentiums. I can't think of an LCD any lower than that. It would make anything CPU-hungry totally unusable.

at least 16mb linear addressable RAM.

a CPU with enough features to support preemptive multitasking.

No applications of any consequence would be able to be developed without
these assumtions...

Systems which could squeak by would be:

Amiga
Atari ST
68K MAC
386/486 PCs
Apple IIGS (slow as molasses, probably, but doable).

None of the 8-bit systems would qualify, and the overhead of a HAL is
probably too much for a 64K RAM system anyway, that you'd get more
mileage out of their native OSs.

If your Atari is esconced in a bedroom or rec room, you may want to get one of the 13-inch TV's with A/V input/output jack (often with built in VCP or VCR when the jacks are present), and it can do double service. Otherwise the straight monitors are scarce, as you said. I had to use a monochrome green composite monitor (salvaged from a Taco Bell that was upgrading its cashier/order system!) for a year on my 8-bit to use AtariWriter until a friend let me borrow his old color composite.

2598. Who owns the rights to Antic and ANALOG?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-12 00:00:00 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <61revc$grl@alexander.INS.CWRU.Edu>
Source record: 69528

Hello.
I have a/some question re:Antic and ANALOG.
ANALOG ended with the 12/89 issue, #79.
The remaining subscribers at that time received an
'equivalent' subscription to an equal number of Antics.
Now, here's the question. Does James Capparell own the
rights to ANALOG? I mean what was the deal that ANALOG
essentially signed over subscribers to Antic? Did LFP give
the rights to ANALOG (all of them) to Capparell, in return
for 'taking over' the ANALOG 'commitments'?
I heard that Antic just quit on their subscribers at the end
(4-5/91), and left people with remaining subscriptions with
nothing. (Now if I'm trying to get info from or about James
Capparell, I'd be smarter to talk only nice about
Antic/Capparell.)

The above is mostly my memory of hearsay. I apologize in
advance for any inaccuracies or offence.
Russ Gilbert

Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit

Mr Maddog <mrmaddog@microserve.net> wrote:

> - What's the best and the worse 5200 game IYO?

Lots of them are very good. Most of them, actually. Bounty Bob
Strikes Back, Pitfall II, and Gyruss are my favorites, though they're
also available for the 8bit. Space Dungeon takes top prize among the
5200-exclusive games.

Worst games are Congo Bongo and Quest for Quintana Roo. Real
stinkers.

> - Which 5200 games are "better" than the 8-bit version

Centipede, Qix, and Star Raiders. But they aren't very good
candidates for conversion to the 8bit because of controller issues.
An 8bit hack of 5200 Centipede already exists, but IIRC it doesn't
support the trakball in the same way as the 5200. 5200 Qix requires
two buttons, and 5200 Star Raiders makes use of the analog sticks.

> - How do you like 5200 joysticks? (Like I need to ask...)

I can't even remember the last time I picked up a 5200 stick other
than to brush the dust off. :)

> - Would you really like to play 5200 games on 8-bits if you
> could, even if they're "hacked"?

There's not much among the 5200 library that isn't exactly duplicated
on the 8bit, and what isn't duplicated really can't be ported without
loss of a critical controller function. Space Dungeon is pretty much
the beginning and end of it.

It doesn't really need to be said, but porting games from the 8bit to
the 5200 would make you a hero among 5200 fans. Get cracking on
Asteroids pronto. :)

Message-ID: <61sn64$sn6@nntp02.primenet.com>
Source record: 69391

What do you do with the FAX when you get it? Gr.8 is too low a res to resolve a FAX and laser printer support for the Atari8 is poor, so you're talking about dot matrix output which probably will look bad.

And as for sending faxes, there is no scanner software to speak of for the Atari8, and word processors don't really generate printer output at a high enough resolution to be captured for FAX, do they?

I don't see how it's practical on the A8.

Level 15 is also where I stop. Gemdrop is really exceptional, like someone
said - the best game of the year :)
There's something I don't like about it, though. This many-color-screen-mode
flickers horribly on my PAL machine. Less colors would be MUCH better if
there'd only be less flicker. If you don't mind, Bill, please also make
a non-flicker version. I'd love it!

If you can't find anybody to get them off your hands, then you can give
them to the Digital Antic Archives at

http://sunsite.unc.edu/kevina/atari/mag/antic/

It's just a thoughtful suggestion, but I'm sure they would appricate
having some more issues to all type in :)

Heheh.. I played again yesterday. I beat my high score of 36,000-something
and got like 44,000-something I think.

I got to level 19... it was really funny when I died, too... I KNEW
it was about to happen, and just screamed "Noooooooo!!!!" until it did. :)

Also, if it's "best game of the year"... it's best compared to what?
What else came out this year? Send it to me! :)

: There's something I don't like about it, though. This many-color-screen-mode
: flickers horribly on my PAL machine. Less colors would be MUCH better if
: there'd only be less flicker. If you don't mind, Bill, please also make
: a non-flicker version. I'd love it!

Yeah.. I tried it on my PAL 800XL and it was kind of wierd. I'm planning
on releasing a "Deluxe" version with better sound, perhaps some music,
and a color (flicker) / BW (normal) option.

No NTSC machine to try it on Marek? :)

2612. ABBUC JHV 97 Germany

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-13 00:00:00 UTC
From: schallt@fh-worms.de
Message-ID: <61t6ip$f7v$1@widukind.fh-worms.de>
Source record: 69396

Hi out there,

it is time for the next ABBUC JHV 97 fair/show for the atari 8 Bit systems.

As every year is the fair held in Herten/Germany on Sa. the 18th of October.

The fair is a point/place to meet other people that are still using their XL/E.

At the fair will be Wolfgang Burger (Boss ABBUC), Joost Kuepp (PCB, Manual libary or do it yourself repair lettres), Erhard Puetz (Floppy Doc) and other people that lead this club with about 500 users.

You can buy games and hardware from different people.

KE - Soft with his great range of XL/E, VCS 2600 - 7800 games and

A. Stuermer (Portronic) - with his sound devices, games ...

Kaisersoft - imports many games from Polen/Tschechien and makes Top Mag (German only)

ABBUC - has a great PD Libary, many Manuals, different hardware, several Cartridges, Abbuc Mag 1- 50 (German), ABBUC Homepage and more.

Many private will also there and sell their used hard- and software.

You will meet people from Polen/Germany/USA/Holland ...

It is possible that the people that invented a AT- BUS Interface are there. They have updated theis Software and now you can use OEM Zip drives with your XL.

CU in Herten

schallt@fh-worms.de

Die diesjaehrige Abbuc JHV findet wieder am 18 Oktober in Herten statt. Wer Lust und Zeit hat kann als Besucher zwischen 12 Uhr und 16 Uhr auf der Messe aufschlagen. Die Messe wird wieder in Herten (Buergerhaus Sued) durchgefuehrt. Hier ein Auszug aus der Homepage vom ABBUC:

ATARI BIT BYTER USER CLUB e.V.

am 18. Oktober 1997

in 45699 Herten, B&#65533;rgerhaus Herten S&#65533;d

Tagesablauf:

10.00 - 11.00 h Aufbau der Aussteller
11.00 - 13.00 h Hauptversammlung
13.00 - 17.00 h Computerschau

Anschlie�end gem�tlicher Ausklang in einer Gaststst�tte

Also lassen wir es mal gemuetlich ausklingen.

Weitere Hinweise auf anwesende Teilnehmer und Aussteller entnehme man der ABBUC Instant Seite im Internet (liegt nicht in der ABBUC Homepage !!!).

Gruss

Torsten Schall

>
> Why do you want one? What's wrong with two 810s?

Or two 1050s, for that matter? (Assuming the original poster isn't a
collector of unusual Atari hardware.)

The 815 is a rather scarce item. Two 1050s are "better" than an 815
(the 815 has two 90K drives; the 1050 has two 130K drives) and are
common and cheap.

And as the 815 is something of a collector's item, it may be fairly
expensive; two 1050s with power supplies, on the other hand, should
be readily obtainable for $50-75.

Of course, if Pradeep is collecting or just thinks it would be "cool,"
then more power. But if the idea is to get the best bang for the buck,
then two 810s or 1050s, perhaps even including one with an archiver chip
or Happy, would be the better way to go.

And the same could be said for people wanting to buy a 1400XL or 1450XLD,
very few of which are around--you could buy three complete 800XL/1050
systems with 850 (or P:R: connection) and a 9600 bps modem for the price
of one of those machines...

Not in my experience... My Linux box doesn't have a video card, for
one. It is a 486 though, maybe new machines do. I do know that one
of our Pentium Linux machines at work has a broken video card in it
and still runs fine. You do need a keyboard, though. Anyone else
think the "Keyboard not found, press F1 to continue" message is a
little ironic? :)

First off, I noticed people were trying to enter keyword searches like "Video Game" (ie, with quotes around it) so I've made the keyword system convert those into Video+Game.

I also noticed some people were trying to use wildcards! (ie: *.arc) So "*"'s are now ignored. :)

I ALSO noticed that some people didn't seem to understand (although it says it all over the place) that this is an Atari 8-bit FTP site search engine, so I tried to make it PAINFULLY obvious. Sorry for you folks who go there and think to yourself "yeah! duh! I KNEW that already!"

And finally, Tom Hunt said he's going to try to get a listing made for his Closer To Home FTP site, so that FTP site will eventually be searchable too!

What other FTP sites are there out there? Who do I need to bug!? >:^)

It would work best if it was a printer driver, so you could just print
to the fax driver (or a file on disk that could be sent).

>I don't see how it's practical on the A8.

It would be neat to be able to receive FAXes, but I don't see much use
in sending.

My linux box is a AMD 586-133 with PCI slots, and it will boot right up
without a keyboard or VGA card. In the BIOS you can set it up to halt on
no errors, which will bypass the keyboard problem. I didn't do anything
to get it to start up without the VGA card.

2625. !!!VINTAGE COMPUTER FESTIVAL!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-14 00:00:00 UTC
From: siconic@jasmine.psyber.com
Message-ID: <61ukkkcpt4@warez.psyber.com>
Source record: 69409

```
Announcing the First Annual Vintage Computer Festival!
------------------------------------------------------

-----------------------------------------
MORE SPEAKERS, COMPUTERS AND VENDORS ADDED!
SEE WEB PAGES FOR MORE INFORMATION!

http://www.siconic.com/vcf
-----------------------------------------

Mark your calendars! The first ever public celebration of vintage
computers will take place at the Alameda County Fairgrounds in Pleasanton,
California this October 25th and 26th.

The Vintage Computer Festival (VCF) is the first event of its kind
anywhere in the world. This two day festival will feature presentations
and workshops by notable computer industry figures and vintage computer
hobbyists. There will also be an on-site, hands-on vintage computer
exhibition. Experiment with the classic computers of yesteryear!

Each year a computer from the past is placed in the Vintage Computer
Spotlight. This year we focus on the Apple ][. To celebrate the 20th
anniversary of this classic,

WE WILL BE GIVING AWAY AN ORIGINAL APPLE ][ PERSONAL COMPUTER!

Each person who attends the VCF is automatically entered into the drawing!

Both seasoned and new computer collectors will enjoy workshops and
panels to share ideas and learn about finding, acquiring, restoring,
and enjoying vintage computers. Visit http://www.siconic.com/vcf for an
up to date list of speakers and workshops.

The VCF also features the Vintage Computer Flea Market. Find those old
computers, peripherals, manuals, and programs you've been looking for!
The flea market is the ideal way for new comers to the field to start
their own collection or for seasoned collectors to add to their existing
stash.

Celebrate the good old days of computing! Attend the First Annual Vintage
Computer Festival!!!

When: October 25-26th, 9:00AM - 5:00PM daily

Where: Alameda County Fairgrounds, Pleasanton, California

Admission: Pre-registered ($SAVE$)
```

Individual: $15
Family: $24 (two adults and four children)

Benefits of pre-registration include:

o Access to speakers, workshops, flea market and
exhibition
o Pre-paid parking

To pre-register, send a check or money order to:

Vintage Computer Festival
4275-29 Rosewood Drive #161
Pleasanton, California 94588

Please make checks payable to "Vintage Computer Festival"

Print and mail the handy form at the end of this posting
for easy pre-registration!

At-the-door

o Speakers, Workshops, Flea Market and Exhibition

Individual: $10.00
Family: $16.00

o Flea Market and Exhibition only

Individual: $5.00
Family: $10.00

Please note: "At-the-door" rate is for a one day pass
only and does not include parking.

For more information including the latest list of speakers and workshops
please check out:

http://www.siconic.com/vcf

or send e-mail to:

mailto:vcf@siconic.com

If you are interested in vending at the Vintage Computer Festival, please
send e-mail to the above address.

SEE YOU AT THE VINTAGE COMPUTER FESTIVAL!!!

2629. Anyone willing to help? - Drive info and expanded ram info needed

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-14 00:00:00 UTC
From: rje@co.umist.ac.uk
Message-ID: <RJE.97Oct14134310@co.umist.ac.uk>
Source record: 69413

Ok.. I've posted this once and apart from dklugh trying it out on an emulator
(thanks) I've had no answers to this request, so lets try again.

I would like to get hold of the configuration block info returned by various
Atari drives. The stock 810 and 1050 don't have one, so no problem there.
I've got the info from a Happy 1050, and now I'm looking for info from other
drives, in any configuration they support, especially double sided drives.

You can get hold of a simple program I wrote to return this info from
my web page: http://www.co.umist.ac.uk/~rje/8bit/readcfg.txt
or e-mail me for a copy.

So why do I need this info?

Well... I've been working on a new ramdisk program which will be DOS
independant and work with most types of expanded RAM. So far I've got it
working under MyDos, Dos 2.0, 2.5 and even the much maligned 3.0 (it was
really cool switching back and forth between the various menus instantly).
The way it works is by making the ramdisk look like a real drive to DOS,
so any DOS should be able to use it without being hacked, even if it doesn't
have ramdisk support built in. Hence my request for the above info.
Of course if you only have 64K extra ram, then not even a SS/SD disk will
fit (you need at least 90K for that) so you can also set up custom sized
ramdisks (so you could set it up for DS/DD even if no one sends me the info,
but still I'd like to include it as a default). And you can have multiple
ramdisks set up, so if you want to use your 1Meg ram with Dos 2.5 then you
can just set up as many ramdisks as you need (up to a maximum of 10).

It should be able to handle any size of ramdisk too, I've tested this with
a 256K and 1Meg XE and it works. It should also be able to handle an 8K
ram under BASIC rom ramdisk (although I haven't tested that yet) so if you
haven't got expanded ram you can still have a (very small) ramdisk.

Now for the downside... the code uses the ram under the OS so it won't work
with anything else that does too (most Spartados versions, TurboBasic and
others), and it won't work with 400/800's either unless they can be modified
to have that same ram under OS as XL/XE's do.

Mmmm.. while I'm at it what other types of memory expansions are there around
for XL/XE machines?
I know about the standard XE type (16K banks appearing at 16,384 to 32,768,
bank switching at 54017 using various bits for different ramdisk sizes)
Are there any other types of expanded ram?
What are the bank sizes? where do they appear? what address is used for
switching? what bits are used?
Also what bits are used in 54017 for other XE ramdisk sizes? 128K? 192K?

512K? etc...

Once I've got this working I'll put the program up on the net so that anyone who wants a copy can get one. And I'll be looking for people to test it out on different machines with different Doses. So the more info I get now the more systems will be supported.

Ta..

Hi all,

I have updated the GENOS website to reflect the changes and fix the errors that many of you noticed. It can be found at:

http://www.alphalink.com.au/~zhulien/GENOS.htm

If anyone is willing to mirror the site, and take on it's maintenance, please let me know.

Regards

Julian Cassin

Sending a fax would be possilbe and practical; most machines implement a fax
driver as a printer driver. That way, output from programs is easily
redirected to the fax. Making an F: device would be feasible; it could even
use the stock Atari character set, providing some graphic elements.

I'd guess that such a beast would require expanded memory to be practical;
say one 16k bank that gets swapped in by a small block of code when the F:
is called.

I vaguely remember some scanning software for the Atari 8bit called EASY SCAN that was advertised in a 1989 Antic magazine. It could only do gr.9 grey scans, but was cartridge based and supposedly the 'best' one out there (meaning there are others?)

I agree with you, even top res 320*200 faxes would be fuzzy to read on an Atari 8bit. (I print out faxes on my 24 pin roland raven using WinFax, not only is it slow, but the quality even on a 24 pin printer is low.

Not very practical, but certainly possible.

Heck, the 5200's analog stick is really nothing more than a pair of
paddles. It would be a trivial task at all to connect a 5200 stick
directly to a joystick jack on the 8bit. Reassign a couple of the
digital direction inputs on the 8bit to work as fire buttons and you
can preserve the two-button nature of the 5200 stick too.

I thought about this for a while and I don't believe it can be done. The Atari 8bit is limited to a screen resolution of 320 x 192. So you can't even have an appearance of modern text on the screen, much less graphics.

If it were even to be tried... I would develop a crude tiny font that squishes 80 columns into a horizontal resolution of 320. I believe this could be done. It would look flaky at first but it would not flicker and you'd get used to it.

You can make a crude but legible letter in a 6 x 6 block.

Then as for graphics, they would have to be two color. Dither the pictures down, down, down on a hidden screen, then cut and paste them into character graphics and stick them up on the browser screen.

So theoretically, it's sort of possible. But in a practical sense, it's hopeless, and only a real retro weirdo would even try.

Except for the CPU. most have a Z80, while the C64 has a 6502.

: a CPU with enough features to support preemptive multitasking.

Well, even a 6502 can do that. Look at
http://www.tu-chemnitz.de/~fachat/csa

: None of the 8-bit systems would qualify, and the overhead of a HAL is
: probably too much for a 64K RAM system anyway, that you'd get more
: mileage out of their native OSs.

That, on the other hand is true IMHO. If you could write a
HAL and p-code interpreter for an 8 bit machine, it would eat
up already quite some amount of memory. For the application not much
would be left. Probably a single-tasking OS would work.
But running a multitasking system like that, with an appropriate
speed?

Well, anybody said that real multitasking would be impossible on a
6502, and I (amongst others) did it, so I should probably
shut up. But I think that only precompiled code would run well
on an 8 bit machine. And then you still have to handle relocation
and linking (shared libs) questions.
(See also on my homepage for the OS/A65 operating system for a
filesystem standard for 6502 programs.)

Congo Bongo's 'very' bad on the 8-bit as well, too much obvious use of
character graphics :P

Yeah, I kinda figure it would. Wish I had a 5200 to play around with. I
don't think Centipede on the 8-bit uses the trackball feature, I only know
of Missle Command and you have to press Control-T to use it.

I'm quite surprised that they haven't even tried to emulate the "analog"
feel using a digital joystick, mostly just the ol' 8 directions I suppose.
The idea in my head is really to try to get 5200 games to run on 8-bits
and even emulate the free floating(when neccesary) controler feel. I know
it's a bit of a hard task, if not virtually impossible, but it's something
I feel can be worked out. Like I said, it's just an idea and I'll need
some time to work my skills up to that level.

> It doesn't really need to be said, but porting games from the 8bit to

Heh, the 5200 stick can easily ape the arcade type controls. Or better
yet, have "vector" style graphics in GR.8 mode :)

Probably so, but...

What if you had a large scrolling display, larger than 320 x 192? And
1-bit graphical browsers are not unheard of (e.g., the Newton has one).
Definitely, you'd have to have more than 64k ram--more like a megabyte.

It's probably possible, technically speaking. Practically speaking, you'd
have to be nuts to build it or use it.

What I'd like to see is an 8-bit emulator as a browser plug-in or helper
app--click on a bootable disk image or executable and it runs it right
over the web! Now, that would be very practical :-)

Mark

>
> - What's the best and the worse 5200 game IYO?

That's a tough one. I'm always partial to Montezuma's Revenge
for some reason, and this version is nice, but the sticks help
make the game suffer as opposed to the 2600 version.

Space Dungeon and Gyruss both rock. As well as Miner 2049er (either),
Qix, Ballblazer (these last two and Gyruss ROOOOCCKKK with a sub-woofer
stereo setup), Dreadnaught Factor, Pitfall II. Millipede proto with a
trackball is really sweet, too.

The stinkiest one I have seen was definitely that one by CBS (I think)
where you drive around to different planets on a crowded screen in deep
space (I forget the name). Totally pointless game, but the opening
intro. is really nice, ahead of it's time. Reminded me of the intro.
to Alternate Reality for some reason.

Other dogs are Buck Rogers (man that game is dull) K-Razy Shootout
is just a Berzerk ripoff that doesn't have speech or Evil Otto ala
the 5200 Atari Berzerk. Not sure what the point is on that one either.

Most fruity game once again goes to Congo Bongo because of the wacked
isometric angle, and the wildly loud and optically crushing color
scheme. The gamplay is equally wacked, too.

> - Which 5200 games are "better" than the 8-bit version

Couldn't tell ya.

> - How do you like 5200 joysticks? (Like I need to ask...)

I actually like them the most out of any classic era stick. I love
the smooth, rolling response they have. And they are accurate. The
self-centering ones are the best. Of course, their track record
on reliability is the pits, but if you do find one that works, and
you take care of it, it should last awhile.

I also like the fact that all those buttons are on the controller and
are not hard to operate, unlike the Intellivision buttons that were
always a pain to operate, keypad or fire buttons.

> - Would you really like to play 5200 games on 8-bits if you

Most of the exclusive 5200 games have already been ported back to the 8-bits.

Berzerk, for instance, has voice synth, which is great.

Gremlins is cool, but the audio is screwy on XLs.

5200 hardware registers are in different places from the 8-bits so it's more than just the controller issue. You have to go in and patch some code here and there.

2646. Re: Any comments Gem Drop

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-14 00:00:00 UTC

Source record: 69430

Two users of my BBS uploaded GemDrop to Thunderdome in the Netherlands. Now I have both an ATR-image and an Atari 8-Bit Diskcomm-file in my games-sig :-)

I have to say this game is real fun ! My current highscore is 21.000 exactly at this time (it's now running on my second Atari). It took me a while to discover what the second option of the OPTION-key was for, but I assume this is for key-pad use ? (ofcourse, I didn't read the docs :-))

Anyways, I played it with an Arcade joystick...

It is a pitty it hasn't got musics in it. If you have found a (cmc?) tune, will a new version be released ?
I have some musics over here, but they're not very good cause I'm not a real musician. Maybe you can implement something like, when you load the game to look for a file named 'GEMDROP.CMC', and when it's found it will play that cmc-music. Then a player can copy any cmc to the disk to listen to when playing Gem Drop :-))

But, I like the game. It's pretty fast. A little disadvantage is, it's sometimes hard to adjust the little man to the right place when there are not so many gem's at the screen yet. I mean, a border or something at the bottom would be easier to play I think, however, it shouldn't be to easy to play ofcourse :-)...

Keep coding !

Build an SIO2PC cable!!!! :) It's sooo great! :)

The best you'll do with 1050 is Rick Cortese's simple demo called "mule"
It's at UMich.

ftp://atari.archive.umich.edu/atari/8bit/Diskutils/Transfer/

Or you can search for it on XL Search! :)

Type "mule" at: http://zippy.sonoma.edu/kendrick/nbs/xlsearch/

First, my apologies for posting to this group. comp.sys.palmtop or comp.sys.handhelds better choices for the Portfolio.

Second, my solution was simple--run in DOS mode, available in the SHUT DOWN menu. Afterwards, you exit right back into windows. This alternative slipped by me because clicking on the MS-DOS prompt while still in WIN95 (in so-called protected mode) could not access drive.

> between left and right-cartridge (since the 800 has two cartridge ports).
> What is the difference (if any)? I only own left-cartridge programs.

The difference is to which memory the cardidge is mapped to. The left-cartigde
ROMs appear in the area of 0xa000 to 0xbfff, the right cartidge is mapped to
0x8000 to 0x9fff. I've heard of only one "right cartridge", a basic extension
for the "standard" XL basic, to be used with "Atari Basic" as right cartridge.

2655. pitfall (not II) 'ending'

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-15 00:00:00 UTC
From: pilgrim@daimi.aau.dk
Message-ID: <622inammk1@nf.aau.dk>
Source record: 69439

Hi. I recently started playing the original (?)
pitfall on the 2600. My previous experience is
with pitfall II on the C64 back in the 80's.

I have not finished the game yet, and actually I don't know whether it
is possible. I start out with a time limit of 20 minutes.
Then I run to the right "as fast as I can" (I admit,
this might not be the fastest possible). Then after 20 minutes, I
die. Maybe I'm dense, but I haven't noticed any ways
of getting further down (I assume you can't, and
that only Pitfall II allows you to descend).

Can anyone fill me in on the blanks ? Is there
any "extra" goals I can reach - can the game be "finished on time" ?
I usually get a score somewhat larger than 85000
- should it be much larger ?

We had a VT100 program that worked with our 80 column board. I believe I still have the source. If I ever receive the disk drives I ordered, I'll see if the disks are still good, and can post the code if there's an interest...

Oh sure it would...but I was thinking of having a very small "background"
program read the stick and keypresses and translate it into what the 5200
program can use. In fact, it's quite easy to just "poke" numbers into the
registers where the paddles are read.

As for a two button controller, it's dead easy to use a Sega Genesis for
that. Just read a "paddle" value from the C button. :)

Rainbow does have at least one advantage over XL-it: You can criticize it
without getting flamed by others for being ungrateful. :-)

Seriously, I'm sure Marcus had his reasons for offering XL-it for free.
Even so, I paid the shareware fee for Rainbow a couple years ago and have
not regretted it once. Chris' support has been very good, with regular
updates and improvements, etc.

It's great when software's free, but you do have to take into account the
lack of responsibility to the users it usually implies, regardless of the
quality of the software.

Mark

Well, then you get into an awkward scrolling arrangement that is beyond
the abilities of a standard 8bit, which is what I was ruminating about.

> Definitely, you'd have to have more than 64k ram--more like a megabyte.

The Atari 8bit has a Lynx browser, doesn't it? The program I suggested
could probably manage in 64k.

Ideally I would like to have a near standard 8bit with the XEP 80 to do
text-based telecommunicating and word processing, etc.

I would also like info on "Diamond OS" which I thing was an icon based
operating system for Atari 8 bit. And can a mouse be used?

Dave

Truly the best of the 5200. You forgot Mountain King. I'd also love to see
the
Frisky Tom proto, I have that on my SFC Nichibutsu Arcade Classics and it
rocks.

Could that be Parker Bro's Astrochase? It most definitely has a crowded
screen.

What about Blue Print? Now that's whacked. :-)

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien vs Predator and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs for stuff to trade at: http://www.teleport.com/~bensmith/bscomputers.shtml or E-Mail bensmith@teleport.com for a trade.

FREE Catalogs for Classic Atari 8 Bit or Atari ST Computers! Hard Ware, SoftWare & Books/References! In BSC's Catalogs, you may find some thing you've been looking for, Something you might want & something New to you! View Catalogs at: www.teleport.com/~bensmith/bscomputers.shtml. And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/ or if you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can't attach files to your E-Mail. I will get back to you after the weekend. Please Direct all Replies Through E-Mail to: bensmith@teleport.com.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitor, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's

Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of

Developers and Others who Support Atari. And Bravo Sierra Computers is
on the list. Also, you can find A list of Atari Support on BSC's Web
Site. The Atari Developers, Sellers & ReSellers of Atari that I go to
for Help.

: > - What's the best and the worse 5200 game IYO?

: That's a tough one. I'm always partial to Montezuma's Revenge

Monty rocks on any platform, but the 8-bit/5200 version is probably the
best due to the larger color variety..

: stereo setup), Dreadnaught Factor, Pitfall II. Millipede proto with a
: trackball is really sweet, too.

Pitfall II is great too, but only on the 8-bit.. dodging condors, etc
with those far-traveling 5200 sticks is an excercise in frustration,
especially on the 2nd level! As for Millipede, if it's anything like the
8-bit cart version, I'll take the 2600 version over it anyday.. seems
like the 2600 got a much more accurate port all-around...

: > - Which 5200 games are "better" than the 8-bit version

don't they all play the same, except of course for the controller?

: > - How do you like 5200 joysticks? (Like I need to ask...)

they'd have made good specialty controllers, for games like space dungeon,
etc. but a digital controller should've been the pack in IMHO. I have
a Competition-Pro now, so I don't mind much now :) The keypads and
buttons DO have a nice feel, if only they would've used graphite on ALL
the flex's.. The Coleco and Intelly controller keybaords felt cheap
compared to 5200 ones. The best keypad was probably theWico stick for
Colecovision... thing looks and feels just like a telephone keypad..

: > - Would you really like to play 5200 games on 8-bits if you
: > could, even if they're "hacked"?

Sure.. one less system to have cluttering up the area, plus I can get
S-video out of my 130xe.. Pitfall II never looked better :)

Thats both wrong and right. Some PC motherboards do have video built-in, so
you don't have to have a video card. However, AFAIK, they are in the vast
minority-so most PC computers -do- have to have a video card... :)

5200 thoughts:

Being a lucky owner of Meteorites, I have to say that it's a very good Asteroids conversion (was it released for Atari 8-bits?).
Berserk is the best console translation of the Stern classic I've seen -- the built-in speech was revolutionary for the time. Star Raiders is pretty good for the 5200, but I'm glad I have the overlays for it.

Pitfall II is excellent, especially the tough second level. Anyone know a shortcut to get to Level 2 without going through Level 1?

Defender is always fun and so is Gyruss if you have a perfectly functioning stick.
Gremlins is an interesting idea with good graphics. It grows on you. I also love getting out the trakball for Centipede and Missle Command (it works with Ms. Pac-Man, Galaxian and Pole Position among others).

The graphics in Wizard of Wor aren't that good, but the game rocks, especially with two-player simultaneous action. Blue Print is fun and has pretty good graphics.

Gorf sucks because control is so poor.

Kaboom! is great, especially in dueling mode. It makes good use of the 5200 sticks.

Here's one for all you 5200 stick haters out there: The 5200 was the first system I ever owned. I had played INTV and 2600 before, but I grew used to playing with the 5200 sticks. I actually like them for many games -- even Pac-Man -- except for the fact that the buttons are unreliable.

>I have found them difficult to find! No surprise though...

I would recommend a Commodore 1702 or 1902 monitor. Both support split video (similar to S video but implemented by having separate inputs for chroma and luma signals), as well as composite video. The 1902 also supports RGB.

They do pop up in thrifts now and then, but yes, they are a little hard to find. 2 1902s just appeared in a local thrift for $10 a piece. A great deal! If you need one quick, ask around on the Commodore newsgroup (comp.sys.cbm). Someone will reply with one for sale.

Another thing you may want to pick up at a thrift is used VCR with composite outputs. Try and verify the tuner works (they usually do, tape playing mechanisms are what break most often). Your monitor can double as a TV.

2682. How do I save a game?????

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-16 00:00:00 UTC
From: "Kory M. Keith" <msmcl303.kkeith01@eds.com>
Message-ID: <34466BDD.1709@eds.com>
Source record: 69466

Can I save a game using XL-it .20?? I was digging through some old adventure games that require a save game disk to save games. I read in the docs that XL-it doesn't format disks, but is there any way around this so I can use a save disk with this emulator??

Help! anyone?
Thanks,
Kory

You can't go further down. But in the original pitfall, the
underground passages are shortcuts. So there is a sort of a puzzle to
be figured out as to which shortcuts to take.

> can the game be "finished on time" ?

I think the game can be completed, but I am not sure.

Brent

I've always thought it would be kind of cool to use the extra inputs
on a second POKEY (per the Gumby stereo mod) to read a 5200 joystick
for 5200 games.

That's only true for 'modern' BIOSes, older one e.g. for 386 bsed machines
did not have the opportunity to remove
the keyboard checking after boot.

2686. FS/T: Atari 8-bit computer items [10/16/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-16 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <344ba8f0.5566483@nntp.ix.netcom.com>
Source record: 69470

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 10/16/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 5.00 Home Filing Manager, The (Atari)
$ 5.00 Print Shop, The (Br0derbund) {3}
$ 5.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 5.00 Timewise (Atari) {1}
$ 5.00 Touchdown Football (Electronic Arts) {2}
$ 5.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$ 9.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 8.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$ 9.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$13.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).
$10.00 Book: Atari BASIC [332 pages, 1979, Wiley]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 7.00

*****

LOT #2

ATARI 1010 PROGRAM RECORDER, with power supply, and manual.

This item has not been tested.

I have plugged in this recorder, and it did power up. The
rewind and fast forward (advance) functions work. It must be
hooked to a computer to test the play and record functions.

$ 9.00

*****

LOT #3

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #4

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$23.00

*****

LOT #5

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #6

EPSON RX-80 PRINTER with built-in power cord.

$14.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,

3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

Maybe you can do the opposite of what we do here to enjoy European Pal games:

Put in an NTSC chip in your pal computer. It should "trick" it to think its an NTSC.

2689. WTB: Non-working Atari 800 w/ good keyboard....or just keyboard...

Newsgroup: comp.sys.atari.8bit

Source record: 69333

Hi,

I have a bad keyboard on my 800, and I need a new one. Anyone have a non-working 800 with a hopefully good keyboard they are willing to part with for a reasonable price?

I called B&C, and they wanted $35 for the keyboard only! I have seen working complete computers selling for $50 at the most, so $35 for just a keyboard is really out of line.

Any help would be appreciated!

I just noticed he headers I'm puting out.
Well I'm not in 640x480.
It's obviously using he over-scan version of 640x480.
(704x480,I think)
And what's the "Mozilla" comment for???
Do I really have to look like one of the popular HTTP programmes?
Isn't being 2.0 compliant enough?

Actually I was talking about SpartaDOS.

> I agree 100% with Kluge about reading the manual. Why waste
> ten minutes reading the manual when you can go straight to
> the computer and spend hours trying to figure it out and
> then have a neat discussion on csa8? (Actually, I don't
> read the manual, didn't read about 9 and 12 in SD books.)

I didn't say anything about reading the manual.I remember reading
about the ability to create "Sparse" files and to write past the end.
(there's anoher bug;reading sparse files causes them to be non-sparsed)

The problem is that he file seem to be infininetly long.
After reading the last byte of the file,it keeps adding on sectors
until you un out of disk space.
(at least it blanks out the sectors,unlike MS-DOS)

As fo the one guy's comment about programmes relying on errors;
how else would a programme kno when it had reached the end of the
file excep for a error-136?
(same applies to any readable device)
And don't say SpartaDOS's "get file length" XIO!

> And for Bob Klass. I checked to see if my crc16 (v 2.2)
> worked with SmartDOS. Well, it didn't get the same problem
> as with MyDOS, and

Hmm .. My current Linux box is a 486SX/25, but I think I remember that
keyboard option in CMOS setup from my 386SX/16 I had awhile back.

The Monkey Wrench II .... thats real close to "atari tools"
and it sucked.
Why not something useful like a debugger for asm so you can test out
those a=usr(1536) calls

I hope he plans on a battery to retain memory while the system is turned off,
it would be just hell loading the 16meg ramdisk each time you turn on, It
hell with just 1 meg!

Im sure he must be using simms, just think of how many 256k dram need for it.

Bob if your reading this:
Please release a RD handler for sparta dos, the outstanding PSI ramdisk handler
can handle only 2 megs.
Good luck, and I cant wait to see this mod.

William Kendrick <kendrick@zippy.sonoma.edu> wrote:
>Heheh.. I played again yesterday. I beat my high score of 36,000-something
>and got like 44,000-something I think.

36,000 is my high score now. With this game it's mostly luck if you get a high score or not. When the tiles are placed the right way, you can blow them away very quickly. On the other hand there are situations where you can do close to nothing.... and die.

>I got to level 19... it was really funny when I died, too... I KNEW
>it was about to happen, and just screamed "Noooooooo!!!!" until it did. :)

Happens to me all the time. And on all kinds of levels (well, say from 7 up on)

>Also, if it's "best game of the year"... it's best compared to what?

Let me think... uhm, compared to.. nothing? ;-)

>What else came out this year? Send it to me! :)

Lots of demos I guess... No games.. Or, well. I did one or two levels for some old type-in games in BASIC (Kitten, Dungeons of Xotha). Check
http://www.uni-karlsruhe.de/~un55/Atari8/soft.html
for both games. I'd love it if someone could contribute some new levels for Kitten. The game has a level editor, so it shouldn't be too hard to make some new ones.

>Yeah.. I tried it on my PAL 800XL and it was kind of wierd. I'm planning

You know what? I'm not particularly fond of the appearence of tiles that show up in level 12, or 15? I mean those mostly one color triangles or whatever. The shapes in the first level are much nicer. Those "past level 15" shapes look quite weird on my monitor.

>on releasing a "Deluxe" version with better sound, perhaps some music,
>and a color (flicker) / BW (normal) option.

Great!

>No NTSC machine to try it on Marek? :)

Unfortunately no. A friend of mine did have a NTSC Atari 1200XL with the appropriate monitor, but he sold it :(

-Marek

< Atari car-power >
Well, the 600XL is powered by a voltage-stabilizer (7805,2A). It's mounted in a box, together with a fuse and a switch to turn it on and off together with my XF-551 diskdrive, which has a modified powerconnector to let it work at 12 Volt DC only...

That power-box is connected directly to the car-battery, so it can be left on while leaving the car.

But... the stabilizer is using some power to drop the voltage from 12 to 5 V DC, so, it's not just the Atari who's taking up power...

I think the current is about 1 Ampere with only the 600XL turned on. My car-battery is about 100 AH, so in theory I can use my atari for about 100 hours till the battery has run out of power...

I almost never use the Atari when I'm not in my car. It has a home-build interface inserted with 16 outputs to switch the light of my car on and off. Looks pretty cool ! The software to do this is on a 5.25 disk, running from the XF-551, but I also have a 3.5" mechanic that also has to be build in the car, but this is not done yet. Another problem is that I sold my little TV that was mounted in my car, so at this time I have no display :-) Right now I'm searching for a very little color-TV to connect to my 600XL. The old one was a Black'n white...

When installed I can play Pole-Position again on my way home :-))

2698. Re: Any comments Gem Drop

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-17 00:00:00 UTC
From: sysop.fox-1@stackbbs.xs4all.nl
Message-ID: <877806747@stackbbs.xs4all.nl>
Source record: 69342

Well, I finally reached level 15 while playing GemDrop. My highscore is about 52,000 at this time, and it's to hard for me to beat level 15... I'm playing this game in the Netherlands, so on a PAL Atari 130XE, but I didn't noticed any flickering. Maybe because I use an ordinary color-TV with a very slow screen :-))

A friend of my was also curious about GemDrop. He has also an Atari 8-bitter, but is not using it anymore since 2 years or something. When he played the game for some hours he decided to dig-up his 65XE again, together with his XT (he's using SIO2PC cause he hasn't got a diskdrive)...

My CoSysop has played GemDrop also. Well, he's definately addicted to it ! I couldn't use my computer for about 5 hours when he was visiting me ! Now he's complaining about pain in his hands from handling the joystick... And he's still stucked at level 11 :-))

B.t.w. I'm using 1050 diskdrives, upgraded with Speedy's. In your code I saw you're 'searching' for Happy 1050-drives. But... when I'm booting the game, my Speedy will not be recognized as a high-speed diskdrive. I tried to convert the My-Dos disk to a Turbo-Dos disk, but it isn't working the way I want to. It'll work when i skip the GEMINTRO.AR0 file, but I want to run it completely.
It'll also not run with Sparta-Dos 3.3b.

When I boot it from a computer with a blackbox attached, this isn't a problem at all, cause the blackbox takes care of the highspeed mode of my Speedy, but is it possible to implement also a speedy-detect routine ? I can't do it myself cause I haven't got an ACTION! cart.

Anyway, the game is good ! More of that would be great, and an upgrade with music is also welcome. I like music in games...

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 10/16/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 233 for various 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site,
including 12 for the Commodore Vic-20 computer!

I have the following printers available, for sale or trade. These
were acquired with various computer systems, and while they may work
with more than one type of computer system, I have included the
type of system that they were acquired with, where applicable.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

HARDWARE:

NOTE: The Lots listed below include only what is listed!

Accessories:
$ 6.00 Star SG-10/15 Dot Matrix Printer Users Manual

****

APPLE][COMPUTER:

LOT #1

APPLE IMAGEWRITER II PRINTER with power cord.

$49.00

*****

LOT #2

APPLE IMAGEWRITER PRINTER with power cord.

$24.00

*****

LOT #3

STAR GEMINI 10-X PRINTER, with built-in power cord, and Users Manual
(266 pages). Can be used with the following computers: Apple][,
Atari 8-bit, Commodore 8-bit, IBM PC, Osborne, and TRS-80.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$40.00

****

ATARI 8-BIT COMPUTER:

LOT #1

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #2

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$23.00

*****

LOT #3

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #4

EPSON RX-80 PRINTER with built-in power cord.

$14.00

****

COMMODORE 64 COMPUTER:

LOT #1

RITEMAN LQ [model LTR-1] TERMINAL PRINTER (InfoRunner / Japan Electronics Ind., Inc.), with manual and built-in power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 7.00

*****

LOT #2

COMMODORE MPS801 DOT MATRIX PRINTER, with built-in power cord.

I have plugged in this printer, and after powering it up the power light came on and the print head moved.

$ 9.00

*****

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address (this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

Excuse me? You mean that we should pay Chris for his emulator just because
he's a "good old boy" , updates his software on a regular basis, and is nice
to you when you call him on the phone?

This is absurd!! My point still remains:Rainbow may be the best supported
emulator out there, but the fact still lingers over Chris's head: it's
inferior to some free emulators available. Of course free software usually
means less support and responsibility but that's part of the price you pay
for a free emulator. From my point of view, however, I had far more
problems getting the Rainbow Demo to run than getting XL-it to run.

Face it, Mark! You got burnt, just like me ;o) !!!! I'm sure Chris spends
a lot of time tweaking his emulator and I'm doubly sure he's a hard worker
and feels he's entitled to some type of reimbursement. My original message
still stands....If he manages to make a product that's much better than
what's freely available I WILL buy it. Rainbow shows promise, but not $35
worth of hard earned money.

Personally, I would be steamed if some kid came around, wrote a program that
was much better than mine, and then had the audacity not to charge for it.
I would kick it into high gear and make my product that much better. But

that's me! I've always been one to support free enterprise and
competition.......

MK was one of those oddball games I never really cared much for. I think
I beat it on the 2600 way back when. Maybe the 5200 does it better justice.

I remember that I traded some game from my original collection (which I
still have intact to this day) for MK (2600) but cannot for the life of me
remember what I traded away for it. I still have MK with the manual.
I doubt I gave up anything rare, though. :)

Everytime I sit down to play Blueprint I keep expecting the world of it
for some reason. I can sorta figure out what is going on (it kinda
plays like Pressure Cooker but a lot more confusing) but never have
the patience to keep trying. It is pretty whacked out. I guess I should go
look up the manual again on the net. :)

You just get a file FTPed in text mode.Useless for DCM files.
The exact same thing using Gopher with FTP gateways.
If RETURN doesn't work then you can't download the file.
(unless it really IS (non-Atari) text)

Of course I've always used "d" not "D" but I don't see "D" in the Lynx
keymap.

The answer would likely be yes, even on an unmodified XE/XL.

If you have an old 800, or a XE/XL with a the chroma mod, or better yet,
the SuperVideoXL2.1 mod, the answer is "definitely, absolutely better".

Keep in mind S-video will eliminate artifacting, which is actually used by
some games to display color. For everthing else, however, the display would
be a definite improvement.

>I don't see how it's practical on the A8.

Just to add some fuel to the fire, the Commodore 64/128 has a fax application called GeoFax (which as the name implies, also requires the Geos operating system).

>What do you do with the FAX when you get it? Gr.8 is too low a res to
>resolve a FAX and laser printer support for the Atari8 is poor, so you're
>talking about dot matrix output which probably will look bad.

That's probably one advantage the C64/128 has with GEOS; a "write once/run many" environment for printer drivers. Running under GEOS, printer support is already taken care of, including a decent selection of inkjet and laser printer drivers. Too bad Berkley Softworks (now GeoWorks) never adapated GEOS for the Atari 8-bit. (They did do it for the Apple II series, but it never caught on there).

>And as for sending faxes, there is no scanner software to speak of for the
>Atari8, and word processors don't really generate printer output at a high
>enough resolution to be captured for FAX, do they?

Even at "fine" resolution, a fax is about 200 dpi (actually either 198 or 202 dpi; I cannot recall which), and "normal" resolution halves that vertically. Both resolutions are similar to a 9-pin printer ("fine" being similar to the best a 9-pin could achieve, but still well below that of a 24-pin printer).

Speaking of scanner software, GeoFax affords C64/128 users access to a scanner, as all they have to do is fax the material they want scanned in to their Commodore, using a standard fax machine (either locally, or on the sly at work <grin>).

BTW, have you noticed how cheap scanners are getting? I have seen flatbed color scanners below $100 now. While overkill for an A8, you have to wonder what this is doing to the market value of old greyscale flatbed (and sheetfed) scanners. I suspect some people value these so little that they may be literally trashing them. (It always irritates me when people trash perfectly good equipment without even attempting to sell it for a token price, simply because it is "obsolete").

If some type of scanner support could be developed for the A8 (either via a BlackBox or other SCSI interface, or the development of an EPP/ECP port add-on + software), these old "junkers" could be scarfed up and put to good use.

<STEFAN@iehk.rwth-aachen.de> wrote:

>YAMAHA Chips?!? Never heard of a YAMAHA 80 column chip...

Yamaha made the 9938 and 9958 VDP chips for use in MSX-2 machines.

It is no surprise you never heard of them, as MSX machines (which were
based on the TI 9918 or 9928 VDP chip) never hit the US in any numbers.

The 9938 and 9958 were backward-compatible with the 9918/9928 chips (i.e.,
would support the same graphics modes), but also added new modes, including
a "low-res" mode of 256 colors at 256x212(or 192), and a "high-res" mode of
512x212(or 192) with 16 colors. Both modes can be interlaced, resulting in
double the normal vertical resolution.

It should be noted that unlike the old TI graphics modes, the best of the
new graphics modes support "any pixel, any color", rather than the
"cell-type" limitations one would normally encounter on a TI chip (similar
to those C64 users face).

In the US, you are most likely to encounter a 9938 chip in a Myarc Geneve
9640 (an advanced TI-99 type machine that installed as a card into the TI
PEB, and used the same peripherals, but used an XT keyboard), or the TIM or
other 80-column cards for the TI-99/4A.

While I have seen a Geneve in operation, I do not have one. I do, have a
TIM in one of my 99/4A's, however, it was damaged during shipment to me
when the board popped out of the socket and went roaming around the innards
of the machine, and I have yet to attempt to repair it.

Source record: 69346

On 12 Oct 1997 16:58:46 GMT, "Austin Franklin" <dar8kroom@ix.netcom.com>
wrote:

>I want to find a composite video monitor for my Atari 800... Anyone have
>any suggestions?
>
>I have found them difficult to find! No surprise though...

I cannot say I have ever found it to be a problem.

Depeding on how fast you want it, and how much you want to pay, here are a
few paths to take:

(1) Post a "WTB" ad here and in comp.sys.cbm. This should net
a few offers of appropriate monitors (i.e. Commodore 1701,
1702 or 1802). If you have an upper limit on the price you
want to pay, be sure to mention it.

(2) Check out comp.sys.amiga.marketplace for the same monitors,
and keep in mind Commodore/Amiga 1080, 1084, and 2002
monitors also support composite and chroma/luma inputs.
I can attest from personal experience that the 1080 makes an
excellent A8 monitor, and can often be had for close to the
same price as a 1702. Magnavox 8CM515 and 1CM135 monitors
can also be used.

(3) As someone else suggested, pick up a small (or big, if you
prefer <grin>) TV with A/V input jacks. You may also want to
check for S-video inputs, as this can be used with the Atari's
separate chroma/luma outputs; all it takes is the proper
cable to wire it up, although since this is not an "off the
shelf item", you would likely have to build it yourself.

(4) If you have a VGA/SVGA monitor, pick up an external TV box,
like "Instant TV", "AVer TVGenie" or "ProView TV". Aside from
incorporating a remote-control TV tuner, these also support
composite inputs, allowing your A8 to display to a VGA/SVGA
monitor. All but the Proview also support S-video input.

My local Best Buy sells the Instant TV box for about $129, and
all three are available mailorder.

Does anyone have or know where I can get the documentation for
SpartaDOS?

Thanks in advance,

itrek@mindspring.com

2714. EXE -> ATR help needed

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-18 00:00:00 UTC
From: rbjones@remove_this-therightside.demon.co.uk
Message-ID: <3448c936.2632576@news.demon.co.uk>
Source record: 69348

I tried to convert an exe to an ATR but when I tried to use it with Xlit it just came up with a boot error. XFormer also came up with a bott error I think.

I used a util called Imageman and created a new ATR file and added chuckieegg.exe to it and then saved it. Didnt work though.

What did I do wrong ? Are there better utils of converting EXE to ATR ?

Ive looked at Jellystone Park and the best files are in EXE and not inATR and I didnt see ATR versions of the ones I wanted.

2715. MAC65 commands?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-18 00:00:00 UTC
From: Austin Franklin <darkroo4m@ix.netcom.com>
Message-ID: <01bcdbf2$c379f6d0$a6ca23c7@drt1>
Source record: 69349

Anyone have a list of MAC65 command line switches and editor commands?

It comes up just fine, and says EDIT. If I type "MAC65 SAMPLE.M65" it
gives me an assembly listing of the SAMPLE.M65 program...fine...but how do
I load a source file from within the MAC65 EDITor?

Thanks,

Austin Franklin

The 815 is two 180K drives designed for Atari Dos 2.0d. And I would like one as well =)

The ATR file needs to have an operating system. Try making a copy of a DOS
2.5 or Mydos boot disk and put chuckieegg.exe into it (remember, Atari DOS
only allows 8.3 file names). Rename the exe file to AUTORUN.SYS and it
should run when you boot the disk image.

Actually, Yamaha did release a more advanced chip in the series (9990VPD, as I recall) that would handle 31.5Khz (VGA) scan rates, and had even better graphics modes, but it found little use. Some overseas MSX users did create a graphics board using it, which is how I first learned it existed.

One reason it was not so popular, from what I understand, was that it did not offer any more for the money than VGA chipsets did at the time of its release, and with MSX-2 and 2+ apparently no longer on the market anywhere by that time, the 99x8 compatibility was of little consequence.

>be figured out as to which shortcuts to take.

OK. Things start to make a lot more sense...
I assume that the game can be completed now. I have
shortcuts now, that take me to about screen 100, and going
there takes 4-5 minutes (can maybe be done somewhat faster).
Judging from that, there should be at least 400 screens.
(There may be more, or the game may deteriorate into an evil
maze). Phew, this is going to take some time.
At least I understand now why people bothered to play the
original. At first, I thought it was a little simple compared
to Pitfall II.
Thanks.

I too found the time to run Gem Drop from my PC over to the Atari. I think Gem Drop is very addictive, like Tetris and such. It's quite a good effort done in Action! I think the game is quite hard though and didn't get further that level 9. But, I only tried it a couple of times, so I'll get further soon. BTW : William, are we gonna do the game or what ? Please email me and preferably, send the graphics too. We'll start coding as soon as possible! Take Atarian care everybody and I can say it again! Good job William! Like it a lot!

Would any computer need to be
>turned off except when they
locked up?

Yes as a matter of fact they would. It is the only way to re-boot for
Boot ONLY
software, as is any Atari 8-bit Dos! Unless of course you happen to have a
hardware
upgrade that allows a simulated coldstart, or you use a software method of
coldstarting the cpu.

>BLOAD in MAC65, but no luck...

Are the .MAC files by any chance plain-ATASCII text files? (I.e. can you TYPE them (in a command-line DOS), or copy them to the E: device (in a menu-oriented DOS), and see readable source code? If so, you may be able to get MAC/65 to ingest them with the ENTER (not LOAD or BLOAD) command...

(FWIW, MAC/65's LOAD command expects to read a "tokenized" MAC/65 source file. The BLOAD command expects to read a DOS-loadable "binary" file. And the ENTER command expects to read plain-ASCII text, ideally but not necessarily comprising MAC/65-syntactically-correct assembly source. If your .MAC files _are_ text, but are _not_ in precisely MAC/65 format, the lines of text will still be stored, but will contain error messages which you will have to edit out, along with editing the original line into MAC/65 syntax, before you can assemble the code.

2733. 800XL for sale/trade!

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-19 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <62cu17$ui0$2@sally.dma.org>
Source record: 69367

I've got an Atari 800XL, with power supply, tested and working,
for sale. I actually sold it to a guy in California over a month ago,
shipped it out, but then the post office returned it a couple of weeks
ago. Several letters and e-mails were returned as well, so this guy up
and moved, died, or something, and now I've got the 800XL back again. He
paid me $35 for the system, which includes the $10 it takes to ship it
out. Now I'm asking only $29, or would also consider a trade for some
stuff I need.

What I need:

some sort of vt100 terminal emulation cartridge
games
joystick

Dan

In a message dated 7-3-95, Mathy Van
Nisselroy said:

"Man, I wished there was an 80
columns 256 (or more) color
upgrade for the classic Atari."

Perhaps someone needs to turn Mike at
FTe on to the Yamaha 9938 or 9958 VDP
chips. They'll provide both
80-column output and have 256-color
modes, interface easily with an 8-bit
bus, are compatible with NTSC scan
rates, and use their own RAM.

Both provide RGB analog output, while
the 9938 also does composite.
The 9958 loses composite output
(which if needed, can be generated
externally from the RGB output), but
adds some goodies such as horizontal
hardware scrolling and YJK mode,
which is a HAM-like mode that allows
over 32,000 colors on screen at once.

Oh, and they both have hardware
sprite support, also.

Subject: Yamaha video chips

Date: 13 Jul 1995 21:41:31 GMT

They are great chips. Sega used
chips from that series in their
original master console and in the
Genesis. They are based on the TI
video chip in the TI/99,
Colecovision, and MSX computers and
were originally developed by yamaha
for MSX-II or MSX-III or somesuch. I
think the third party super TI/99
(don't remember the name, I just had
a friend who was a TI fanatic) which
was pretty snazzy for its day (back
when Amigas and STs ruled the earth)
used one from that series, probably
the same one as the Sega Master
Console.

I've been trying (not too hard) to
get data sheets and a good source for
these for a while now.

Does anybody know if they support
external video through like the
original TI chips?

Brent

>8-bit Atari is Mac65. IMO the best assembler package that
>was ever made for this machine.

The assembler itself in Mac/65 is fast and powerful. But it was always
crippled by an inexcusibly horrible editor.

Have you looked into the MAE assembler, for which I recently released a new
version? It has a full screen editor with block moves and copies, key
macros, multiple line undo, automatic 'JSR' and return to subroutine or
data labels, automatically takes you to lines with assembly errors, and
many other nice features. The assembler has full text substitution macros
for a lot more flexibility than Mac/65, and it is fully 65816 and 24-bit
compatible. The debugger can reference symbol table labels and assemble
single program lines.

If you haven't seen it, and would like me to EMail you a .arc file of the
package, let me know.

John Harris Japanese translation of Microsoft slogan:

Has anyone else had this problem...

You try to bid on an item at E-Bay (or even just browse around and see what they have) and their server doesn't respond?

I had this problem twice in the last week with them, and lost out on two auctions. But not only did I loose out, but the seller too, because the bid I was trying to make when their server failed was higher than what the items sold for!

If you've had this problem, I would like to know...

Thanks,

Austin Franklin

Im still having problems with this..

I got hold of a copy of MYDOS453.ATR and made a backup copy of it and called it MYDOS.ATR

Then, I renamed the file chuckieegg.exe to AUTORUN.SYS and added it to the MYDOS.ATR file.

I then try this file with XFormer and I still get a BOOT error. And afterwards, the file must be corrupted by XFormer as its filesize has been decreased.

Any solutions ? Is there another utility to do this apart from Imageman ?? Please let me know.

Barry

hi,

is anybody can explain me what is the difference between a SIO/PC cable and
the other the XFORMER ? I have the schema of the two, and the xformer one
is more easy to build : i think ?

thanks

Right now the XFormer software doesnt allow you to write back to Atari disks, it can only read them(The software is also VERY picky about 'synchronizing'. Seems Derek hasn't gone to many user interface classes). The SIO2PC software allows reading and writing. I don't know if its the cable or just the software. Lord knows we won't get anything good out of XFormer so I'd stick to the SIO2PC cable which works as advertised.

Well son of a gun! Emulators, Inc has changed the web page again. I don't see any downloads anymore either. Atari 8 bit emulation is now packaged with Gemulator. I can say though that Xformer 3.6 was available for a while as Xformer Classic on the Emulators, Inc web site with an explanation that it was the last version for DOS. Xformer 95 was the new one for purchase at that time. That version worked in Windows 95. I have to admit, the Gemulator packages look pretty neat. I know there are a lot of bad feelings out there about the owner/programmer of Emulators, Inc, but I for one haven't found a faster emulator out there. Like most other emulators, there will be a lot of programs that don't work, but when you find the ones that do, you'll be amazed at the speed. Remember those BASIC programs that took forever on an Atari 800? They can fly on Xformer running on a typical Pentium. Antic's 3D Maze Escape is a lot of fun. Anyway, that's my 2 cents.

On Sat, 18 Oct 1997, Mike Taylor wrote:

> Does anyone have or know where I can get the documentation for
> SpartaDOS?
>
> Thanks in advance,

I have an original SpartaDos 1.1 disk with manual. Works on all 48k (or
better) Ataris, including the 400/800.

I also have original disks for these games by mastertronic
Crystal Raider
Dispatch Rider
Ninja (C64 one side/Atari 48k other side)

Diamond OS demo disk (64k) with manual
(a scaled down version of Windows-style environment, not as full blown as
the cartridge version, but you get the idea)

Dos XE by Atari (master disk) with original docs

If I sell them individually, $5 plus shipping seems fair, but I would
lower the price if more items were bought.

If you or anyone else here is interested in any or all of these disks,
send private e-mail to the above address. Thanks.

Barry. Don't know much, but you seem to be trying to 'add'
a file to a disk image. I don't think this will work. You
need to un-atr the mydos45.atr, the write the chuckie.exe
to the un-atr'ed disk image. ATR is just a disk image,
an image of all the sectors on the disk. Somehow xlit can
use this disk image to boot from, I suppose. But you need
to write the .exe file to the un-atr'ed image, not add an
.exe to an .atr file. I'm not sure this is what you're
talking about. But I think you may have missed the basic
concept of .atr files (disk images) and .exe files (
executable file).

2759. disk to xfd or atr through R:

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-21 00:00:00 UTC
From: geep@sd.znet.com
Message-ID: <62jbkg$2a1$1@usenet76.supernews.com>
Source record: 69243

Does anyone know of a good program that I can use to transfer a full disk on the Atari side (800 to be exact) and send it through a null modem cable and write to a .xfd or .atr file? I want to backup all my old atari disks to image files, and so far none of the programs that I am using are working. I made a null modem cable, and it works ok through a regular term program on both ends, but when I use disk2xfd or diskform it won't transfer properly through the R: device. disk2xfd just locks up when it accesses the R: device, and when diskform transfers the data through xmodem, it comes out as a short block error on the ibm side. Anyone have any ideas or suggestions?

Geep

>
> Geep

I guess you have two choices:

1. You can save the transferred files on your hard drive or on
floppies and then convert them. I know, it will take more
space that way, but once the conversion is done, you can
delete the transferred file.

2. The smarter way is to get an SIO2PC cable, and either SIO2PC
or A.P.E. software. In fact, if you're using a null-modem
adaptor in your cable, you can use the same cable for both
with an AB switch to select SIO2PC or null-modem. I actually
use an ABCD switch in my system, so the cable also can connect
to my graphing calculator and to another device, if
necessary. If you use the SIO2PC, you just make the .ATR by
"duplicating" a disk from your physical Atari floppy drive to
a virtual drive set up by the SIO2PC or A.P.E. software.
Your PC will hold the disk image in RAM until you tell it
where to save it.

About the games you bought at JHV (Rockman, Wloczyki, Sexy-Six, etc...)

These games will be sold by Markus Romer, who is one of the publishers of
TOP-MAGAZIN. He's selling lots off Poland, Tsech and Slovakia games...
The last few years we bought more than 100 games from him.

More info about TOP-MAGAZIN:

Free disk-magazin for every ATARI XL/XE computer with at least 64Kb RAM.
Copyright by KAISERSOFT, but may be freely copied. May be included in
PD-lists. Price for 6 magazine's: 25,- a 20,- DM (German Marks).

Address to contact TOP-Magazin:

Markus Romer
Schiefersteinstr. 10
55606 Kellenbach
Germany

Tel: (+) 06765/96 00 46
Fax: (+) 06765/96 00 47

There will be 6 magazine's published in 1 year.

Sorry, KAISER-Soft hasn't got an E-mail address...

p.s. Magazine's are in German. Excellent layout !

Message-ID: <877806772@stackbbs.xs4all.nl>
Source record: 69247

In a previous message Glenn Saunders said:

"What do you do with the FAX when you get it?"

FAX! What else? :-)

Glenn: "Gr.8 is too low a res to resolve a FAX..."

Most FAXmachines have NO screen at all.

Glenn: "... and laser printer support for the Atari8 is poor, so you're talking about dot matrix output which probably will look bad."

There was a time when we didn't have 14k4 bps or harddisk support. No 80 columns, no ZIP drives, heck, there was a time when 16kB and a cassette recorder were HOT.

Glenn: "...And as for sending faxes, there is no scanner software to speak of for the Atari8,..."

Just picking up data from a scanner, maybe changing it a bit, and then sending it to the FAXmodem shouldn't be to difficult.

Glenn: "... and word processors don't really generate printer output at a high enough resolution to be captured for FAX, do they?"

Somebody could write something like DaisyDot, but instead of turning textfiles into "super deluxe" printer graphics it cwould turn textfiles into "fax-files".

Glenn: "I don't see how it's practical on the A8."

I do.

CU Mathy Van Nisselroy

Howdy STeve

You: "New software for Atari 8-bit computers? What an unheard of concept! I'd be dancing in the streets for cow mooing simulations, but GEM DROP is actually a fun game. My compliments on your programming efforts and Atari 8-bit web site."

GEM DROP seems to be a nice game (I'll have to check if there is a DOC file). It was a big hit on the yearly meeting of the ABBUC. But it was not the only new game.

Seems like there are still people/companies in Poland that come up with new games. Here's a few I bought at the meeting. Guess you don't know 'em (now that I look at them I see that they are a bit older). Like:

* Sexy Six - (c)1995 Sikorsoft - a MasterMind like game with a beautifull woman somewhere. I've seen it on the meeting on a TV screen and on my 65XE. Unfortunately most European 800XE and 65XE computers have a bug in Graphics 9, which somehow mixed in with another graphics mode in this game.

* RockMan - (c)1995 Mirage Software - a jump-onto-walk-around-pick-up kinda game. Nice graphics. You American people will fall of your chairs.

* WLOCZYKIJ - (c)1993 LK Avalon - I forgot. But great graphics.

Only disadvantage to these Polish games is that the documentation is in Polish.

But the guys whom I bought them from
had more and he even said he was
expecting more. Bought them for $5
(DM10) a piece. I guess his name was
Marcus ... (something starting with
R. If Stefan and Matthias are ready
this, please help. It was the guy
that sat at the table perpendicular
to ours. The one with the TV and the
strange - Epyx - joystick..)

2766. Austin 80 on XE??

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-21 00:00:00 UTC
From: mathy.van_nisselroy@stackbbs.xs4all.nl
Message-ID: <877806770@stackbbs.xs4all.nl>
Source record: 69250

Howdy Austin

You: "Out of curiosity, why would you
want to move it to the left slot?"

Because I thought that a right slot
cartridge would only work on an 800.
I only have XE computers (FIVE of
them, but one of the XEGS's doesn't
work) and was under the impression
that the Austin 80 wouldn't work on
it. BTW is it NTSC only? Can it be
converted to PAL?

You: "There was an RGBI color
option....and that was really cool,
especially for the time (1982)!"

So this was NOT standard. If you're
gonna release the plans and software,
will the color option be in that
"package"???

You: "Personally ;-) I think it was
an excellent product for the
time....it was quite an engineering
effort...."

But how good or bad is it now :-)
and most importantly, are the parts
still available?

You: "It only works in the Atari 800.
I don't know what PBI is...."

PBI stands for Parallel Bus
Interface. It's a port on the back
of most XL/XE's that has most of the
signals that can be found inside the
computer.

You: "If enough people were
interested, I could post the
documentation I have in ...jpg or
.gif... I really don't want to type
it all in now...but eventually, I
guess I will."

I know I am. (especially if I can gt
it to work on my XE's) If you have a
scanner with OCR (character
recognition) you don't even have to
type it in.

BTW can user groups place the plans
and software into their libraries?

CU Mathy Van Nisselroy

PS you say it maps in at $D5xx. Does
that mean it takes up all memory from
$D500 to $D5FF?

Patrice,
The XFormer cable is used specifically with PC Xformer 3.5 and up to directly READ Atari format floppies from an Atari 8-bit floppy drive. As mentioned in another reply, it can only do READ. No write operations. Mine works great!
The SIO2PC cable is designed to work as an interface between a real Atari 8-bit computer and a PC. This allows the 8-bit to use .XFD/.ATR Atari disk images on the PC's hard drive. Ther are a couple of programs that use this cable. A.P.E. being the best, SIO2PC (the earlier original one) and a couple of others. This cable goes between the SIO port and the PC's RS232 serial port. The XFormer cable goes between the PC parallel (LPT1:) port and the SIO port on the Atari floppy drive.

Hi,

Can anyone help me ? I'd like to connect my old Atari 65XE to the PC comp.
via RS232 cable. But I don't remeber if it has RS232 or not. I'm afraid
that there isn't such a connector. If so, is there possibility to connect
them (with costs as minimal as it can be ;-))

thanx in advance,

If I remember right, the Xformer cable is for connecting an Atari disk drive
to an IBM* computer. The SIO2PC cable connects an Atari computer to an IBM,
and the IBM computer acts like an Atari disk drive.

> Please point me an URL.

Here's an idea:

Why doesn't somebody set up a web-site for levels made for classic games. A lot of old games have level-editors, and have gone out of fashion before the WWW became as popular as it is today. Nowardays, there aren't many games with level-editors, so instead, there should be a way of uploading levels for old games so they can be shared. I believe that many games use the same format for storing levels, so Atari 8-bit Boulderdash levels can be used with the C64 version and vice-versa. Unfortunately, a lot of these games use non-standard disk-formats (eg. Mr. Robot level-save disks), so some sort of utility would have to be written for the XL to convert Mr. Robot levels into the sort of disk-format that can then be converted into DCM or XFD. That way, they can be uploaded and shared with C64 users, etc.

In fact, someone could also make versiond of these classic games for the PC that use exactly the same level formats (I believe that Mr. Robot under an Atari Emulator cannot access non-standard disks like the one it uses to save games).

I have made a few levels myself for Boulderdash, Mr. Robot and various other games that I could contribute, so if someone does set up such a site, could they please tell me about it.

AE.

The Atari doesn't put out RS-232 by itself. You need an interface. the
Atari 850 will handle up to 9600 baud. The P: R: Connection likewise, but
some production runs will only go to 4800 baud reliably.

The MIO and The Black Box will go to 19.2K.

Also remember that all of those devices use a DB-9 connector which is NOT
wired like the DB9-DB-25 PC cable. You need a special Atari cable to do
the job.

Most XT computers didn't even have CMOS memory. You used dip switches to set
options like number of floppy drives, type of video (mono/color, 40/80, or
none). I don't think there was a setting for "no keyboard".

The 65XE does not have RS232 built in, but it can be added
inexpensively. Look in
http://www.umich.edu/~archive/Emulators/Peripherals/s2pc410.zip
for the latest version of SIO2PC, files, or in
http://www.umich.edu/~archive/Info/Modifications/atserial.txt
is a plan for a simple serial interface.

I didn't catch the whole thread here. Is G-OS going to be a
universal GUI for all 8-bit computers? What existing GUI (if any)
will it resemble? If it were up to me, I would design a GUI
with the best features of GEM (Atari ST), Intuition (Amiga), and
NeXTSTEP (NeXt Computer). Namely, the Object-oriented nature
of NeXTSTEP, combined with the Multitasking and extensibility
of Intuition, along with the straightforwardness of GEM.
One feature absolutely needed for any future GUI would be
some sort of Slip or PPP stack. This would enable a WWW browser,
IRC client, and Mail client to be written, which would
increase the ability of the individuals involved to
communicate easily and quickly. These would be the 'killer apps'
that any new OS needs to gain acceptance.

Ingenious. So Atari had a "check D5xx" routine as well as a cartridge
autostart routine in its OS. Very clever. Is the /cctl line on the
cartridge port similar to the D1xx (or whatever it was) on the PBI in XL
models?

The best way to test the cable is with the latest version of the SIO2PC
software. If you aren't using that, which DOS are you using? If it's
Atari DOS 2.5 or Mydos or some other variant of that, is the DOS set for
more than two drives?

I tried both softwares, sio2pc and ape. Its not working either way. I am using
MyDos 4.53 on the atari side, and its not even showing D2: yet alone anything
above that. I think I might have the sio pinouts wrong, so I will probably
need some kind of documentation on it so I can get the correct wires
connected. Other than that, I can't think of what else it could be.

> I load a source file from within the MAC65 EDITor?

From the MAC/65 manual (paraphrased):

To load a previously SAVEd MAC/65 token file from disk to editor memory:

LOAD #filespec [,A]

LOAD will clear the user memory before loading from the specified device
unless the ",A" parameter is appended.

To load a text (ASCII or ATASCII) file into editor memory:

ENTER #filespec [(,M) (,A)]

"M" will merge the file with whatever is in the editor's memory.
"A" allows entering unnumbered text.

Hope this helps.

Mark

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

Satisfied customers are always welcome back & welcome to get their copy of my free Catalogs.

FREE Catalogs for Classic Atari 8 Bit or Atari ST Computers! Hard Ware, SoftWare & Books/References! In BSC's Catalogs, you may find some thing you've been looking for, Something you might want & something New to you! View Catalogs at: www.teleport.com/~bensmith/bscomputers.shtml. And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/ or if you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can't attach files to your E-Mail. I will get back to you after the weekend. Please Direct all Replies Through E-Mail to: bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien vs Predator and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs for stuff to trade at: http://www.teleport.com/~bensmith/bscomputers.shtml or E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitor, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse

Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in

each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations...
At one link you'll find a Web Site with Michael Currents List of
Developers and Others who Support Atari. And Bravo Sierra Computers is
on the list. Also, you can find A list of Atari Support on BSC's Web
Site. The Atari Developers, Sellers & ReSellers of Atari that I go to
for Help.

Your XEGS requires 5v+ w/ at least 1.5 Amps. The pinout for the DIN connector
is in the FAQ. You will not find an exact replacement at radio shack
because of the special connector, but you could get the supply.

You can get a real Atari XL/XE power supply from Jameco or any of the
remaining Atari dealers. Try www.jameco.com or www.myatari.com.

I'm looking for 2 or 3 Mosaic 64K RAM Select boards with original docs and cabling.

Also, I would like to find the tech info about the Axlon 128K and Mosaic 64K RAM select upgrades necessary to build Axlon and/or Mosaic compatible RAM boards.

Thanks in advance,
Richard

2796. New Classic Computing web page

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-23 00:00:00 UTC
From: chambera@cs.pdx.edu
Message-ID: <62n1tmlfn1@vega.cs.pdx.edu>
Source record: 69280

Hello everyone---I've put together a new page of classic computing links.
I intend this to be an unbiased collection of interesting links for all
"obsolete", unsupported, or otherwise old-but-still-interesting computers.
Let me know what you think! The URL is:

http://www.cs.pdx.edu/~chambera/classic/classic.html

(And yes, it's readable with Lynx--no frames, Java, etc., ad nauseum!)

Alex Chamberlain
chambera@cs.pdx.edu

2797. Ultima II help wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-23 00:00:00 UTC
From: "J. F. Goodwin" <smrgoodw@reading.ac.uk>
Message-ID: <344F4C3D.1EBC@reading.ac.uk>
Source record: 69281

I've been playing Ultima II for the past few weeks and have got totally stuck...!

Can anyone help me out?

I've got a Level 13 character now, I know how to get healed and I also have a horse. I know how to get keys (painful it can be). However, I've got nowhere fast.

I've explored all the time doors I can reach and as many towns as possible. I've also found 2 towers. I cannot, as yet, board a ship. I've searched everywhere for the mysterious Blue Tassles but haven't a clue where to find them. Without a ship I don't think I can proceed. I cannot get too far down into the dunegeons without getting killed (by combat or trap).

Have I missed the obvious location of the Blue Tassles or am I going in the wrong direction altogether?

Any help (short of the whole solution, please!) would be welcomed.

- Joel

> out. Now I'm asking only $29, or would also consider a trade for some
> stuff I need.

What, you mean you took his money, got the machine back, and now you
want more money? ;)

> What I need:
>
> some sort of vt100 terminal emulation cartridge
> games
> joystick

Well I have loadsa joysticks and a few cartridge games; Miner 2049-er,
Donkey Kong, Pac-man, Centipede and a BASIC REV-A cartridge. Also quite
a few spare machines, but note that they are PAL (English TV system).
The cartridges should work fine on your machines, though. Also,
approaching a hundred tape games and about 10 on disk.

I'm after any NTSC Atari's for demo-coding purposes; especially a 1200XL
as they weren't sold over here in England and I can't find one anywhere.
If you're interested in a swap of some sort (for ref, my spare machines
are 400, 800, 800XL, 65XE, 130XE and XEGS), please mail me back.

Probably market capitalization. This number is very popular with
the financial press, as it is so bloated by a bull market in the stock.

Actually, the current version of SIO2PC is 4.16, you can find it at
http://home.t-online.de/home/TGrasel/
Select the LINKS and you will get an arrow with SIO2PC version 4.16.
If you can read German, there is a lot of other nice stuff on that
page too. There are also some English pages.

Bill R. Core (he110@cleveland.Freenet.Edu) wrote:

: Gem-Drop is a vvery well-done game! Imagine if more programs were
: written to take advantage of this increased color graphics mode.

BTW - One would need to write a pretty mean font editor to create the
graphics for this mode.

I did it (rather painstakingly) by hand... not even with a multicolored
font editor! :) Just a plain B/W editor I wrote in BASIC.

The thing that makes Gem Drop look so good (compared to, say, ColrView
modes) is that the palette doesn't change. It just uses the background
color to let you darken pixels and other colors to mix pixel colors.

Because of this, you're able to interlace the pixels HORIZONTALLY
as well as vertically, so you can dither, which makes it less flickery.

Compare: and: To: and: Each which are meant to produce:

RRRR R R R R rrrr
RRRR R R R R rrrr
RRRR R R R R rrrr (a solid block
RRRR R R R R rrrr of dark red)

: written to take advantage of this increased color graphics mode.
: How hard is it to do? Could a handler be written so that one
: could access and use this mode transparently?

Thanks! :) And yeah, a handler could be made. If it were written
in assembler, it'd be very short... easily made into a:

Z=USR(ADR("......"));

call from BASIC. :)

Anyone want to do it?

All you need to do is set the VBI interrupt address (vector) to wherever your
code is, and do this in the code:

toggle some byte
set the character set byte (756) to some_page + (toggle_byte * 4)
jmp the old VBI vector

Can anybody tell me what power supply a Atari 1050 diskdrive needs ?
Like how many volts and amps etc.
Or if anybody can send me a working one thats even better.
Needs to be send to Holland though!

Greets Stefan.

Hi! AFAIK, they are limited demos of each game. For example, I think in
PlanetFall, you can only go as far as the rift...still, its a great way
to preview each game (which was its intended purpose) See ya...! :)

2815. Connecting Printer to XE?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-24 00:00:00 UTC
From: byron05@aol.com
Message-ID: <19971024190200.PAA11316@ladder01.news.aol.com>
Source record: 69299

Hi,
I have an Atari XE, with disk drive. Just recently I picked up an old printer, in good condition, with manuals, that has example programs to use on the XE.

The problem is, the printer is a parallel printer and I don't know how to connect it to the XE. The printer works fine connected to the parallel port of my PC.

Any hint or tips?

Thanks!

Geep,
First, I found that XFormer with the XF Cable works if you boot with the floppy drive set as D1:. Of course PCXf has to have the -X on the command line. Ex.: C:\PCXF360\>XFORMER -X -J -S D1: SD33-1.ATR ... The drive MUST be set (ID switches on back) to the actual drive you want to use it as with PCXf and you MUST use an AtariDOS/MyDOS/SpartaDOS/other bootable disk. PCXf will boot and test the cable then run like normal. If you DON'T get the list of numbers, something is wrong.

Message-ID: <19971024225501.SAA00323@ladder02.news.aol.com>
Source record: 69308

B&C at www.myatari.com sells many printer interfaces. The old 850 interface has a printer port and 4 serial ports. You have to also get a cable specifically for the 850 too. Another option is to get a Microprint interface that goes directly from the SIO on the Atari to the Centronics port on your printer. Still another option is to get the 80 column video adapter for a monochrome monitor that has a printer port on it too. Even though the 850 might seem a little trouble, it's the most compatible with Printshop, and you can use the RS232 port for a modem.

Bostone1@aol.com

2825. Atari 8-Bit picture problems

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-24 00:00:00 UTC
From: Julian Eggebrecht <julian@factor5.com>
Message-ID: <34513CEE.487E13CF@factor5.com>
Source record: 69309

Hi folks,

After performing super video upgrades on two units (a 7800 and an XL) and after looking again after years at my 130XE picture I noticed the rather annoying "Grainy" appaerance due to slight vertical stripes - it seems to be a common Atari video chip thing, since all of the units have it in varying degrees. You see it clearly after an Chroma/Luma/S-Video mod, but even on a good composite monitor, e.g. the blue background after turn-on has the slight vertical stripes. The stripes are caused by the chroma signal - when you do a Chroma/Luma mod they are not to be seen until the chroma is added. It seems as if the chroma signal is slightly off timing-wise against the luma.

I wouldn't bother and accept it if I hadn't have the following experience:
While modifying my 7800 for S-Video, I was adjusting the two chroma levels (the one from the 2600 and the 7800 parts are being mixed into one). When playing around with the itensity of the 2600 chroma in the mix there was a certain point where it made the vertical stripes of the 7800 picture disappear completely - in addition it added noise and other things, but those vertcial stripes were gone.

Now the question: Does any technical minded person know what makes the chroma signal in Atari units behave this way and is there a fix (perhaps a time-base-correction of the chroma signal) for it. It seems to be possible, just looking at the effect I had with the two weirdly mixed chromas...

It is subtle, but if you are used to perfect pictures on monitors as we all are nowadays I find it definitely annyoing - especially knowing that there must be a way to fix it, now.

Any input is very welcome!

Julian Eggebrecht

>
> I'm sold! I'll do it! :)

Ha ha! I read somewhere that you really are working on this, so I hope you consider my opinion that the browser should work on a standard 64k machine, and be based in a 320 x 192 screen, not some awkward scrolling arrangement.

If you are going to try to create such a browser that is your business, but I think you are tilting at windmills. I am sure you are an intelligent person but you should know your limits, because no-one but a genius could pull off a graphic web-browser on a circa 1980 computer.

i have the following items for trade/sale :

1) 800xl w/ powersupply
2) 1050 ..stock w/powersupply
3) 1025 printer .. powersupply builtin
4) 2 sio cables
5) cartridges : joust, donkeykong, miner 2049'r
6) original atari dos ii, copy of mydos4.53 or dos 2.5 (both if you so desire)

all work great. i'm making room in my atari closet (i have about 6 other atari computer, as well as many other peripherals), and trying to build up my cartridge collection.

heres what i'm looking for: i would like to trade the lot for a collection
of cartridges...i don't have many...

aside from that i'll take the highest offer....say after 2 weeks..

email offers if interested,

thanks,
robert

> I didn't catch the whole thread here. Is G-OS going to be a
> universal GUI for all 8-bit computers? What existing GUI (if any)

Firstly we are currently designing a HAL (hardware compatibility layer) that sits on top of the CPU to make all computers (8, 16 or 32 bit) alike from the programmers point of view.

> will it resemble? If it were up to me, I would design a GUI
> with the best features of GEM (Atari ST), Intuition (Amiga), and
> NeXTSTEP (NeXt Computer). Namely, the Object-oriented nature
> of NeXTSTEP, combined with the Multitasking and extensibility
> of Intuition, along with the straightforwardness of GEM.

The OS is the next stage after the HAL and will probably have a CLI and a GUI - I am opting for a shared library/devices scheme like AmigaDOS.

> One feature absolutely needed for any future GUI would be
> some sort of Slip or PPP stack. This would enable a WWW browser,
> IRC client, and Mail client to be written, which would
> increase the ability of the individuals involved to

I agree, and this is definately possible - but not all computers have serial ports. We will be devising a protocol scheme - it may be TCP/IP but it could also be of a new design. If this is a new design, it would be possible to create a program for Unix that impliments this new protocol. It is likely that the new protocol will allow a device independant networking solution in addition to basic communications.

> communicate easily and quickly. These would be the 'killer apps'
> that any new OS needs to gain acceptance.
>
> ////Pakrat

We can already browse the net on our Z80 based CPC (using ZMP and Lynx), A native browser is possible, but we will need to revisit these application issues when we have completed the basic design of the HAL and OS.

If you wish to follow this thread, it has now stopped "MOSTLY" news crossposting, and moved to a proper mailing list. Details of this mailing list are at:

http://www.alphalink.com.au/~zhulien/GENOS.htm

If this is the largeish-tan plastic dealie I believe it is the
external keypad Atari had for some bit of budget software.
Ummmm. Does this plug into the SIO port?

It's just a bunch of demos... Planetfall, Infidel, Witness and
something else I can't remember. And there is a "sample" adventure.
It's very short, and it sucked.

All of Atari's keypads for the 8 bits plugged into a joystick port.
Besides the CX 85 which had keys like the Atari 800, Atari had a keypad
controller that just had little buttons to use with the 2600 version of
Star Raiders, I think. Any verification on this? Also, there was the Kid's
keypad controller, with big buttons on it.

2835. XL-it .20 and Pentium II

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-24 00:00:00 UTC
From: Kristopher Keith <kristoph@post.cis.smu.edu>
Message-ID: <34513A1D.2140@post.cis.smu.edu>
Source record: 69319

Hello,
I have found an interesting problem with XL-it .20 when using on a Pentium II. The first time I use the program it runs wonderfully, but after I exit the program and start it again later, it hangs as soon as I start the emulator part. I have to close it from windows or reboot if I'm in DOS. Has anyone else experienced this?? I have found one workaround, but it is quite tedious. If I delete session.cfg each time before I start the program it will run just as it did the very first time.
Any solutions or reasons for this??

All help greatly appreciated,
Kory Keith

The Blue Tassles are to be found in the Dungeons.

However, there was a bug in an early version of the Atari
8-bit version of Ultima II. There were no blue tassles in this
version.

To remedy this, one would run a special character editor that
permitted one to edit the statistics and items for their party.
Someone could probably upload one to you, or I could dig it up.
It's been years.

Many, many moons ago I wrote up a textfile which defined the
character set for Ultima II (you could make your own landscapes
with it or place fixed boats, spaceships, or horses by using a hex
editor such as Archiver II). Each character is comprised of a 16 x
16 square matrix. I believe it used Graphics mode 0 with two
character sets, but I might be mistaken on that point.

Brian Watson wrote:
> Am I the only one to be worrying about a HAL that will be ready by 2001?

Probably. We passed his birthday at the beginning of the year (April 1997 I think). I wouldn't be surprised if IBM, in some secret back laboratory, put together a supercomputer they named HAL...and nobody will never know.

But what's this about an 8-bit graphical user interface? This is rediculous. 8-bits don't have the power to push pixels. And if you want some GUI for yours, there already are some (GEOS, Apple). Whoever started this string, clean up the cross-posting. Amiga, for one, was NEVER 8-bit!

I really thought this plugs into the SIO port. Does anyone actually
have one and can confirm/deny this.

>like the Atari 800, Atari had a keypad
>controller that just had little buttons to use with the 2600 version of
>Star Raiders, I think.

Star Raiders?

I've got one of those small keypads, but the only thing I used it for
on the 2600 was the BASIC programming cart (which came out long before
the Star Raiders game for the 2600.) Actually, the BASIC cart used
two of the keypad controllers (with a plastic overlay over each
keypad) and they slide into each other to make a single keypad unit.

(It took me all of 3 days to exhaust all the possibilities of that
BASIC cart which them made me decide to get a real Atari computer.)

I still have the keypads. Even used them in a few games I wrote for
the Atari 8-bits.

>Any verification on this? Also, there was the Kid's
>keypad controller, with big buttons on it.

I remember seeing the adverts for the big pad.

: Byron05@aol.com

Yes. Call American Techna-Vision at 510-352-3787. I believe they still
have a device called MicroPrint for $9.95 (cat # MPP633). It's a 5 foot
parallel printer interface cable. It has a Centronics connector on one end
to plug into a parallel printer, and an Atari SIO plug on the other to hook
to the last peripheral in the Atari daisy chain. The computer powers the
interface circuitry located in the Centronics connector cover through the
SIO cable.

Source record: 69324

The CX-85 came with the Bookkeeper program for Atari 8 bits
It plugs into the joystick port and uses the joystick register
to operate with appropriate software. The only programs right
off that can use it are the Bookeeper by Atari and Ice-t, A
Shareware terminal program by Itay Chamiel, Jerusalem, Isreal.

2849. Re: Connecting Printer to XE?

The only way to hook them together is by finding a paralell inteface
such as the Atari 850 or a P:R connection since there is no
standard paralell port on the 130 XE (or any Atari 8-bit for that
matter). A good place to look is flea markets or 2nd hand stores
like goodwill, salvation army,etc you may pick one up for almost
nothing.

The 1050 uses a 9 vac 31va power supply Atari part #CO17945.
This is the same supply that runs the Atari 400/800,1200XL and
I think also the Atari 1010 Tape drive. I don't have any spares
around but if I find someone who does I will give them your email
address.

2851. Graphics Tablet!

Newsgroup: comp.sys.atari.8bit

From: ab616@chebucto.ns.ca
Message-ID: <62s8dk$43a$2@News.Dal.Ca>
Source record: 69327

I have come across a graphics tablet for the 8 bit Atari and was wondering if anyone had any info on it. Does it need stand-alone software or does it work with the system itself? It plugs into the joystick port and looks like an etch-a-sketch but with an attached 'pen' of some sort.

Is this what they used to call a Koala Pad?

Thanks...

It sounds like the Atari Touch Tablet, but I haven't seen a Koala Pad, so it might be that too! For Atari Touch Tablet there was a cart with Atari Artist on that followed it. It's easy to make a BASIC program to draw with it, so that's an option! I might have some extra Atari Artist carts as I have 4 or 5 of the Touch Tablets. Take Atarian care!

Well, somebody made a Graphics OS for the 8-bit, so the main problem is getting a fast enough JPG decoder I guess! Good luck William Kendrick, hope you make it and as I always say ; Take Atarian care everybody. BTW : Are you seriously thinking of learning assembler, William ? Do so, and maybe you can make it work ;-) Greetz from Hawk of Pokey Soft

2855. Re: Wanted : Atari Diskdrive 1050 Info

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-25 00:00:00 UTC
From: Vidar Olavesen <olavese@online.no>
Message-ID: <01bce120$10c859e0$13374382@hawks-pc>
Source record: 69331

The Atari 1010 is the same I think, but the connector is larger and won't
fit in the 1050. Anyhow that's how the PAL PSU I have anyway! Take Atarian
care

2856. Re: WTB: Composite Monitor for Atari 800? Any Recommendations?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-26 00:00:00 UTC
From: he110@cleveland.Freenet.Edu
Message-ID: <62uff8$7jb@alexander.INS.CWRU.Edu>
Source record: 69190

The monitor I am using with my 130XE is a Magnavox CM-135 (I believe from memory) 14" monitor. It has inputs for composite, Split Y/C, TTL, and both Analog and Digital RGB. I use it with split Y/C (Very sharp!). It has stereo inputs, so when I do the Gumby upgrade, I'll just plug it into the monitor and GO! Picked up this monitor at a local hamfest for $50. Perfect shape. I would recommend you look for either this monitor, or an Amiga 1080 monitor (which I was using until it fritzed out on me and I didn't want to mess with it). The Amiga monitor's display was slightly sharper. Both make composite really fuzzy looking! The color is really vibrant.

2857. Re: 8bit Graphic Browser

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-26 00:00:00 UTC
From: he110@cleveland.Freenet.Edu
Message-ID: <62un07$c1m@alexander.INS.CWRU.Edu>
Source record: 69191

IT should not be impossible for a WWW browser to be written for
an Atari 8-bit system. For different fonts, have italic,bold,
underlined, etc, fints in memory and switch from font to font
as needed. As for graphics, Jeff Potter has already expressed
interest in writing GIF encoding routines for such a venture.
Converting to a monochrome screen should be in theory faster
than converting in color, as the simplistic thing to do could
be as simple as a pixel off for 0-127 and a pixel on for
128-255. Dithering could come later as the program evolves.
All WWW browsers do the same thing: take an HTML script, along
with picture files etc., and reconstruct it on a screen.
If we had to, we could grab all the data we needed, send it
to the hard drive, and reconstruct the page from the drive,
which would be faster than reconstructing it from a remote
computer, and would also be available if you wanted to return
to that page during that session.
But a simple text-only browser would be very nice, as then I
would not have to rely on a public LYNX browser that they
could remove at any time and then we would all be SOL.
Extra fratures, like different text types and graphics,
could be added later as the program evolves. Just use the
K.I.S.S. method and we would all have something to build on.
All we need right now is a SLIP stack. A friend of mine
(Lonny Pursell, wrote the most-used IRC program for the ST
maybe you've heard of him) has said that he would like to
convert it to run on Atari8 systems, writing it in
ACTION!. All he needs is a TCP/IP interface. Now that
wasn't so hard, eh? Just allow yourself to imagine what's
possible, rather than try to prove why it won't work.

The cow mooing thing gave me a really wacked-out idea. Suppose Gateway 2000 bought up Atari from JTS. They want to sell. Then Atari and Amiga International would be sister companies! This could be interesting. (My 8-bit computer of choice is the Atari platform, my 16/32 bit computer of choice is an Amiga.) Odd concept, or what?

////Pakrat

2859. Re: PC Xformer 3.60:Damn limited! (no artefacting!)

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-26 00:00:00 UTC
From: he110@cleveland.Freenet.Edu
Message-ID: <62uoou$cdc@alexander.INS.CWRU.Edu>
Source record: 69193

I suggest that all new software being written for the A8 be
written in such a way that it fails to run on an emulator.
If people want to run something for the Atari computer, they
should just get a REAL Atari computer. To do this for the
Xformer is not that hard. just check a couple of locations for
impossible values on a real system.

Atari Hardware / Software Auction

Please send bids to wesseago@juno.com
Please include your name, address, phone number,
item bidding on, and bid.

Bid increasements are as follows:
items less than $10 = $1
items $10 and over = $2

Auction will run through November 2.
All items will be going once on October 29,
going twice on October 31, and sold on November 2.

Hardware
--------------------------------------------------
Atari 800 XL with power supply----------kseiner@edu.uni-klu.ac.at $16
Atari 400 with power supply----------kseiner@edu.uni-klu.ac.at $16
Atari 1050 with power supply----------malyszka@dreamscape.com $19
Atari XM301 modem with box, manual,
and original disk--minimum bid $10
Atari 1025 printer--minimum bid $10
Atari 1010 recorder no power supply--minimum bid $5
Atari 410 recorder with box--minimum bid $5
Atari paddles new in box--minimum bid $3
Atari joystick new condition----------malyszka@dreamscape.com $3
Wico command control trackball--minimum bid $5
Pointmaster fire control plug in--minimum bid $1

2863. An URL of general a8 interest

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-26 00:00:00 UTC
From: "Tom Hunt Sr." <tomhunt@bright.net>
Message-ID: <62vgj8$65d$1@cletus.bright.net>
Source record: 69197

A while back I happened across this URL-

http://world.std.com/~snet/glenda.htm

It covers, among other things, what was happening in the Atari 8-bit BBS community in the late '80's. Some of the "heavy hitters" of that era are mentioned in the article.

Please note that I do not necessarily agree with any of the opinions listed in the above article. I'm just pointing out that it is there.

2864. Looking for M.U.L.E. system in NC

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-26 00:00:00 UTC
From: wsuddert@nr.infi.net
Message-ID: <wsuddert-2610971034500001@pa5dsp7.nr.infi.net>
Source record: 69198

Back in college (88-92), my friends and I were addicted to M.U.L.E.,
running on an Atari 800. Even then, we were feeling a nostalgia rush for
"old computers." Since we've gone our separate ways, the 800 was either
trashed or yard-saled. Sigh.

We've started missing the game pretty badly, and are thinking about
assembling a system for that purpose again. Two questions:

What are minimum system requirements for M.U.L.E.? Will it run on a 400?

Where can I find a CPU, appropriate model disk drive, joysticks and any other
missing hardware, as well as the game, in the North Carolina area?

Thanks,
Will Sudderth
Greensboro, NC

Not very. The Atari 8-bits share considerable design philosophy and architecture with the Amigas. The 8-bits share nothing more than the nameplate with the ST. It's too bad so many Atarians had perfected their knee-jerk reaction to company logos. Many Atari zealots lost out on their oportunity to be involved with the next-Generation Atari as it happened. (Or as ANALOG called the Amiga before the ST came out, "Not the next generation Atari, but the one after that.")

To access the Internet with an 800XL you need the following:

1. Ice-T 2.72 (latest version vt100 emulation, handles
up to 19.2KB directly)
2. An MIO or Black BOX, or a memory expansion to use
a Ramdisk.
3. A rather speedy modem. This is to bypass your own
frustration. I use a Motorola 28.8, and yes at
full 28.8! Hardware Flow control is a wondrous
thing!
4. An Internet Service Provider that allows shell
access. Basically if you dial the number, log in,
and you are at a prompt, you're in!
5. You need the IP to a server that lets you use
a text-based WWW browser called Lynx.
Telnet to either of these:
129.237.33.3
152.2.22.93
The first is the University of Kansas, the second is
to the Sun Microsystems site.
6. For mail access, become a user of one of the
Freenet sites. This is how I can usse
comp.sys.atari.8bit. Here is the one I use:
129.22.8.26 (which is the Cleveland Freenet,
just because it is the closest to me)

You can't really do any usable IRC yet (PLEASE someone prove
me wrong!!!) apart from connecting to the WTnet site.

If you need any more info, please let me know.

////Pakrat

Does anyone have c source to a slip stack? I've got a pretty good c cross compiler. If something like was ported to the a8, it would have to be kept small in order to leave room for applications. I figured 8k could be allocated to a stack handler. I also think that such a system would require the use of a newer BB, or an MIO using Len Spencer's Hyperspeed program. This is because hardware flow control would have to be relied upon. Using this kind of set up, the stack handler would only be called by the application when the application wanted to grab some input. In other words, the stack handler would be the slave to the application, not the other way around. Alternately, the stack handler would be in control, buffering all input and doing a fork() to the application only when it detected the input line was idle. This isn't as good, IMHO.

I do have the c-64 assembly listing to their stack handler, but found it a bit hard to follow. I think the author said he developed it using a network link between his linux box and his c-64. It would almost require a similar setup to debug a stack handler for our a8's. (Anyone have a similar setup, and would be willing to debug the stack handler? I don't.) I think that if we could get the stack handler written in c, then we could make the source available and it could be compiled right into any application, instead of it being a seperate program altogether. C would be easier for most people.

The CX-85 keypad was bundled withe The Bookkeper which was a
full-fledged (for its day!) business accouting package. It was also the
most expensive piece of software ever published for the 8-bit Atari's
listing at something like $495 when it was first released. The CX-85
plugged into the joystick port and needed a driver to support it.

Hmmm. I never found them there. All I ever did is keep killing
thieves; just as they can steal from you, you receive a random item
when you kill them. As soon as I'd kill a thief who gave me blue
tassles, I saved and looked for a boat.

I'm curious about something. What protocols do those anonymous lynx servers offer? I really like the Sailor server because it allows you to choose random URLs, but it only offers kermit. Also, (I used to know all this stuff), do either of those allow you to uuencode and email files to yourself? I remember doing that at one time, using the print command.

The cheapest way of doing what you want to do is buy a 8-bit nintedo and the
mule cart the four player adapter and four joy sticks

go to a place like funcoland the nintendo with two joysticks will run about 20
used, the mule cart about 5, and a four play adapter about 7, and finally the
extra two joy sticks about 8.

You're forgetting that the Nintendo version of MULE is horrible.
Try running it on an emulator... you can actually play the Commodore 64
version 3 player (I don't think any Atari emulators support 4 joysticks)
with PC 64 (and it's nearly identical to the Atari version)...

Ultima II, what a great time I had with that game.

Anyhow,
All objects can be gotten from Thieves. Just keep finding them and
killing them. You'll get the Blue Tassles eventually.

Just to save you some time and aggrevation, in Ultima II the Dungeons
are worthless. Nothing but gold down there.

If you have any questions feel free to email me. I've played that game
inside and out, to the point where I have no more Ocean left, just ships
all over the place (In almost every time zone).

Later,
Steve

Here's something you might want to try, if you haven't already. Load up bobterm on your a8, dial your isp and log in. After this, if you begin to get garbage sent to your screen, pulsed in about 1 second increments, then your isp automatically drops into using slip or ppp. But on the other hand, if you get a prompt, hit a "?", and you'll get a mini menu of about 10 items. The items on the menu include slip, ppp, and telnet.

Most, but not all, of the isp's that claim not to offer shell accounts are of the type that support this type of mini menu. It really isn't a shell account, but since it offers a text-based telnet, you can go all over the world using your a8.

2891. FS/T: Atari 8-bit computer items [10/27/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-27 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <34548696.1367193@nntp.ix.netcom.com>
Source record: 69219

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 10/27/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 5.00 Home Filing Manager, The (Atari)
$ 5.00 Print Shop, The (Br0derbund) {3}
$ 5.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 5.00 Timewise (Atari) {1}
$ 5.00 Touchdown Football (Electronic Arts) {2}
$ 5.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$ 9.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 8.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$ 9.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$13.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).
$10.00 Book: Atari BASIC [332 pages, 1979, Wiley]

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

NOTE: Light comes on, and drive tries to read disk, but drive will
not boot up. Sold as non-working item, possibly repairable, for
parts only!

$ 7.00

*****

LOT #2

ATARI 1010 PROGRAM RECORDER, with power supply, and manual.

This item has not been tested.

I have plugged in this recorder, and it did power up. The
rewind and fast forward (advance) functions work. It must be
hooked to a computer to test the play and record functions.

$ 9.00

*****

LOT #3

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #4

ATARI 1025 PRINTER, with built-in power cord, and manual.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$23.00

*****

LOT #5

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 8.00

*****

LOT #6

EPSON RX-80 PRINTER with built-in power cord.

$14.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your order *before* you place it,

3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

2893. Atari disks and emulators

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-27 00:00:00 UTC
From: serguei demianov <sidemi01@homer.louisville.edu>
Message-ID: <345547E5.1ABD@homer.louisville.edu>
Source record: 69221

Hello,

Just dug out all my old Atari 8-bit software on floppy, and have
downloaded a couple of emlators for my PC. I sold my Atari+peripherals
years ago, but would love to get access to all this amazing software.
Is there anyway to transfer those files on my old disks to my PC without
having access to an old Atari drive to hook up to my PC. I have a 5 1/4
drive for my PC -- can any emulators out there today read Atari disks if
they're in that drive? What are my options?

Thanks
Jay Yepuri

2894. hardware questions

I picked up a couple of items at the local thrift shop that I think are for 8-bit Atari...(I've got 2 130XE's, a 65XE game system & a cpl of 800's)...
I am hoping that somebody can assist with an explanation of exactly what these 2 items are for:

1) a TEXP80 - it has a cable attached with the 9 pin atari joystick connector, an RCA female jack on the box, a DB25 female jack on the box, & an ac adaptor jack... (it came with the adaptor)

2) an XF551 disk drive ...my question on this one is what voltage is the power supply & is compatable with my 130 XE's...

I paid a whopping $3.99 CDN for each item...

Sir,

I sent an email to your email address (didn't see the bottom of this
note). I'd like to purchase one of your 130XEs and two 1050 drives.
lease let me know how you'd like payment, where, and I can have it to
you ASAP.

Hope to hear from you soon (if you could, please respond to email below)

Sir,

2897. scsi drives with the MIO

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-27 00:00:00 UTC
From: cowpoke1@hotmail.com
Message-ID: <877981729.7100@dejanews.com>
Source record: 69225

To anyone with an MIO or who understands the MIO:

I know this subject has been beaten to death numerous times, however it is still not clear to me, so here goes..

I have a 256K MIO and I want to hook up a SCSI hard drive to it.
I know I can get a ACB-4000A or ACB-4070A Bridge Controller and hook up a RLL drive to it, but this is not my goal.

I thought the port on the MIO was a SCSI port and therefore, I could hook up a SCSI drive to it. Is this not correct? If not, then why not?

If I am forced to go down the route of getting an RLL drive, how can I tell if a drive is RLL? I don't even know what RLL stands for.

2898. Is the info-atari8 listserv down?

Newsgroup: comp.sys.atari.8bit
Date: 1997-10-27 00:00:00 UTC
From: cowpoke1@hotmail.com
Message-ID: <877972275.28391@dejanews.com>
Source record: 69226

I tried to retrieve some archived documents today from the
listserv database (listserv@vm.marist.edu) but got no reply...
I have been parsing the postings, looking for hardware and programming
threads. Eventually I hope to put out a document (or documents) that
contain my research (basically alot of how-to documents).

Unfortunately it seems like the listserv is down? Can anyone confirm
this? Is there a mirror site?

Cowpoke.

If you have a drive with an "embedded controller" then you can connect it directly to your MIO. Basically that drive would have the equivalent of an Adaptec 4000/4070 onboard. These drives do not have the ST-506 style connectors (one 34-pin and one 20?-pin) like we're used to in the Atari world.

> If I am forced to go down the route of getting an RLL drive, how can
> I tell if a drive is RLL? I don't even know what RLL stands for.

The Adaptec 4000/4000a is an MFM (Modified Frequency Modulation) controller. The 4070 is an RLL (Run Length Limited) controller. Those have to do with how the data is encoded on the hard drive surface. Basically it boils down to the fact that you should only use an RLL certified drive with a 4070 controller.
